RECOMENDACIONES PARA EL USO DE TERAPIA ANTI-TNF EN LA ENFERMEDAD DE BEHÇET

José Luis Callejas
Unidad Enfermedades Autoinmunes Sistémicas
H. Clínico San Cecilio de Granada

Unidad de Enfermedades Autoinmunes Sistémicas

Erase una vez un turco que tenía una enfermedad de BEHÇET. Todos sus órganos se reunieron para determinar cuál de ellos era el más importante y, por tanto, candidato a ser tratado con antiTNF.

La mucosa oral dijo:

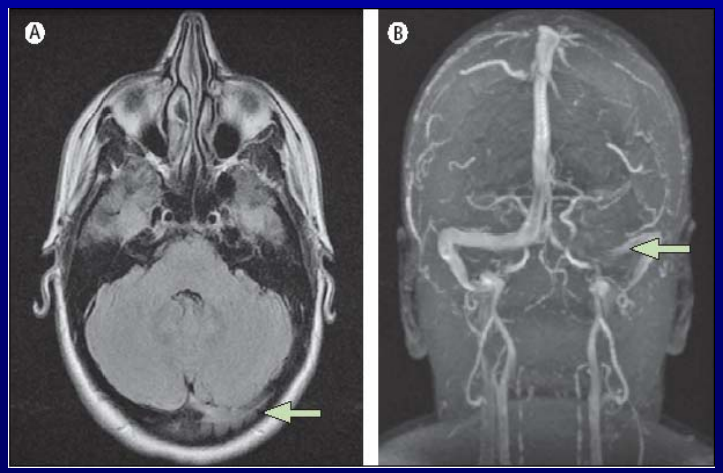
“ Yo casi siempre estoy afectada en la enfermedad y soy manifestación clínica obligatoria en los criterios diagnósticos; por tanto

Yo soy la MAS IMPORTANTE

La PIEL dijo:

“ Yo puedo enfermar de muchas formas y además soy el escaparate para el resto de las personas

Yo soy la MAS IMPORTANTE



El cerebro y la médula espinal, llenos de orgullo dijeron:

“ Nosotros pensamos, controlamos y transmitimos las órdenes.

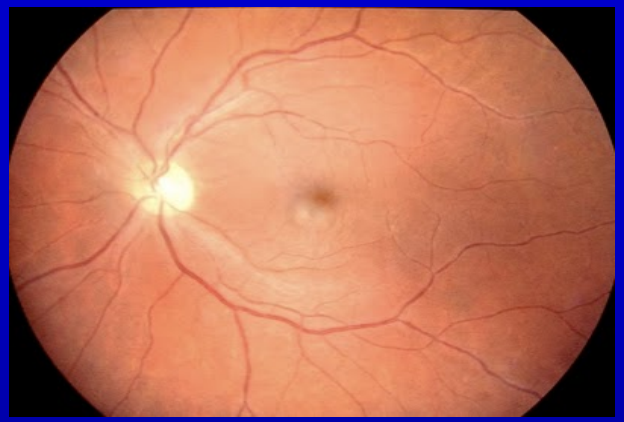
Somos por tanto los ORGANOS MAS IMPORTANTES

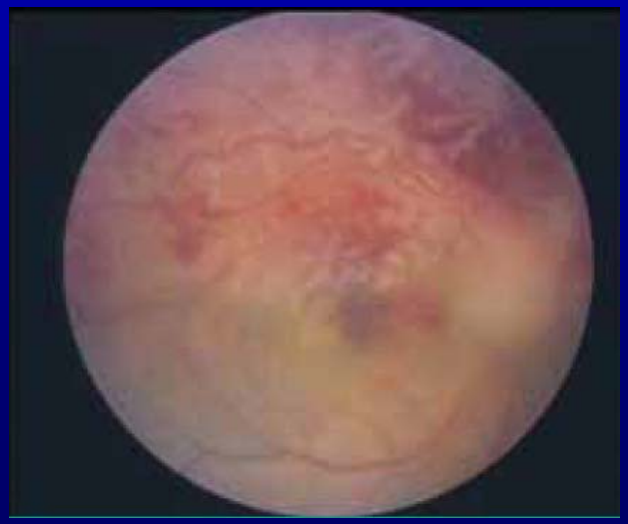
Las “partes nobles” llenas de orgullo dijeron:

“…..

……”

Somos por tanto los
ORGANOS MAS IMPORTANTES

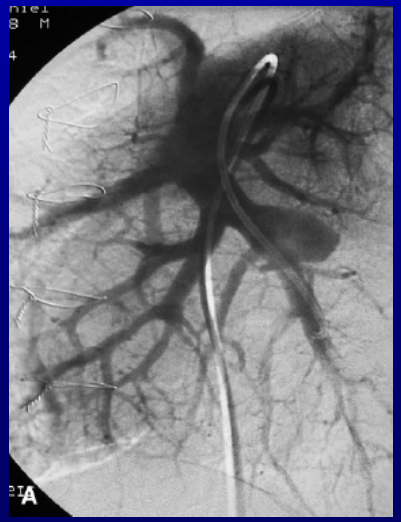




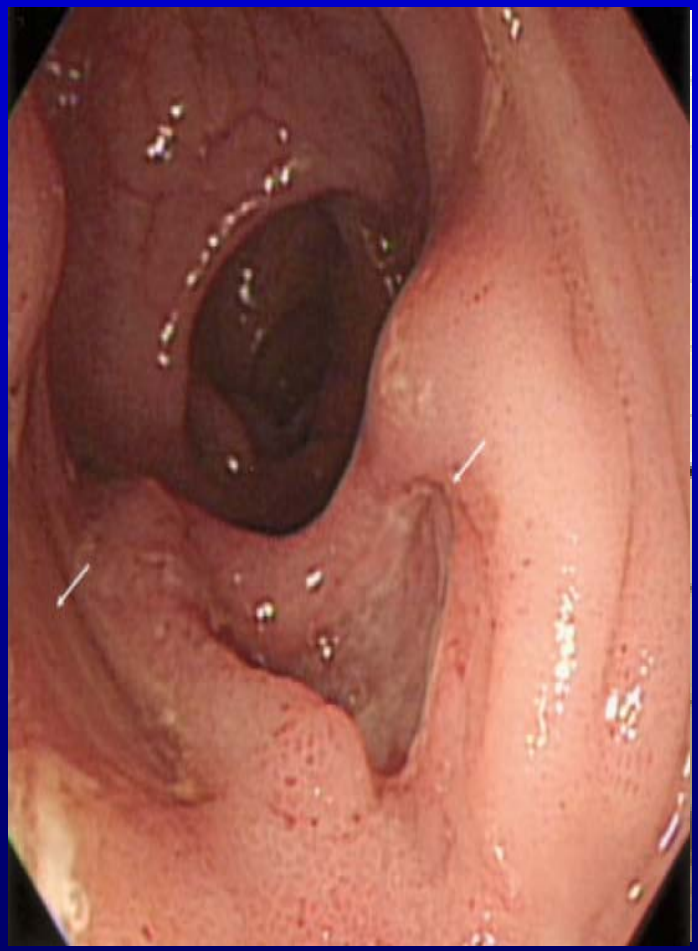
Los ojos llenos de orgullo dijeron:

“ Nosotros somos el órgano de los sentidos más importante, las puerta a la luz, los paisajes…”

Nosotros somos los más importantes



Y así, cada uno de los órganos del cuerpo fue exponiendo sus razones sin llegar a ningún entendimiento



Otro ojo, el del c… dijo, yo soy el más importante.

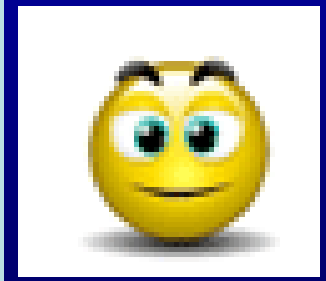
aVF



Ante el desastre, decidieron convocar una reunión de urgencia, en la cual se concluyó que

EN LA ENFERMEDAD DE BEHÇET TODOS LOS ORGANOS SOMOS IMPORTANTES Y, POR TANTO, CANDIDATOS AL TRATAMIENTO CON ANTI-TNF alfa

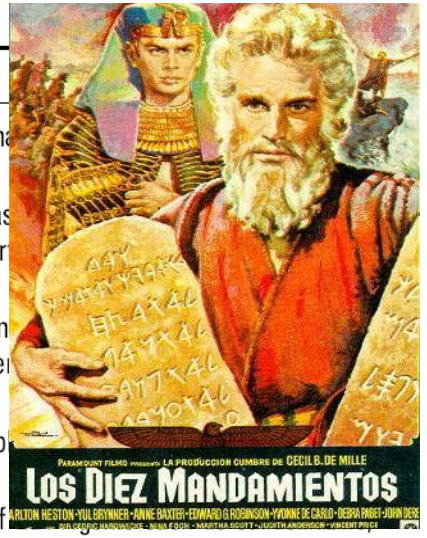
Medline (via PubMed) and The Cochrane Library were searched from 1966 to December 2006. The results of the systematic literature

Table 3 Nine recommendations on Behçet disease (BD) that were developed after two anonymous Delphi rounds

No.	Recommendation
1	Any patient with BD and inflammatory eye disease affecting the posterior segment should be on a treatment regime tha corticosteroids.
2	If the patient has severe eye disease defined as >2 lines of drop in visual acuity on a 10/10 scale and/or retinal diseas involvement), it is recommended that either ciclosporine A or infliximab be used in combination with azathioprine and cor without corticosteroids could be used instead.
3	There is no firm evidence to guide the management of major vessel disease in BD. For the management of acute deep vein agents such as corticosteroids, azathioprine, cyclophosphamide or ciclosporine A are recommended. For the manageme aneurysms, cyclophosphamide and corticosteroids are recommended.
4	Similarly there are no controlled data on, or evidence of benefit from uncontrolled experience with anticoagulants, antip management of deep vein thrombosis or for the use of anticoagulation for the arterial lesions of BD.
5	There is no evidence-based treatment that can be recommended for the management of gastrointestinal involvement of corticosteroids, azathioprine, TNFα antagonists and thalidomide should be tried first before surgery, except in emergencies.
6	
7	s,
8	
9	The decision to treat skin and mucosa involvement will depend on the perceived severity by the doctor and the patient. Mucocutaneous involvement should be
	Leg ulcers in BD might have different causes. Treatment should be planned accordingly.
	Azathioprine, IFNα and TNFα antagonists may be considered in resistant cases.



USARAS TRATAMIENTO CONVENCIONAL SOBRE TODAS LAS COSAS

Ocular Inflammation in Behçet Disease: Incidence of Ocular Complications and of Loss of Visual Acuity

R. OKTAY KAÇMAZ, JOHN H. KEMPEN, CRAIG NEWCOMB, SAPNA GANGAPUTRA, EBENEZER DANIEL, GRACE A. LEVY-CLARKE, ROBERT B. NUSSENBLATT, JAMES T. ROSENBAUM, ERIC B. SUHLER, JENNIFER E. THORNE, DOUGLAS A. JABS, AND C. STEPHEN FOSTER, ON BEHALF OF THE SYSTEMIC IMMUNOSUPPRESSIVE THERAPY FOR EYE DISEASES COHORT STUDY GROUP

The centers involved in the SITE Cohort Study are: the Uveitis Clinic, Casey Eye Institute, Oregon Health and Sciences University; the Laboratory of Immunology, National Eye Institute; the Ocular Immunology Service, Wilmer Eye Institute, Johns Hopkins University; the practice of C. Stephen Foster, formerly at the Massachusetts Eye and Ear Infirmary and now at the Massachusetts Eye Research and Surgery Institution; and the Ocular Inflammation Service, Scheie Eye Institute, University of Pennsylvania.

Am J Ophthalmol 2008;146:828–836.

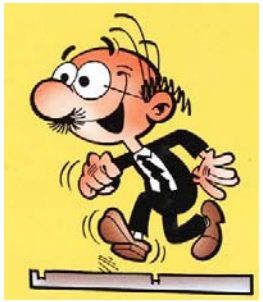

TABLE 1. Characteristics of Patients with Behçet Disease at Presentation[a]

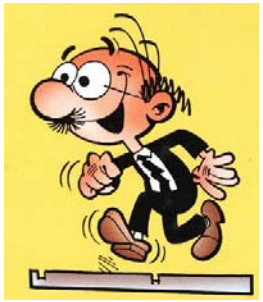
Characteristic	Anterior Uveitis Only	Uveitis Involving the Posterior Segment	Other
Person-specific characteristics			
No. of patients	18	142	8
Median age at diagnosis of uveitis, yrs (range)	31.3 (13.9 to 52.9)	27.6 (4.8 to 64.3)	30.4 (22.0 to 54.7)
Median age at diagnosis of Behçet disease,	37.9 (13.9 to 55.8)	28.3 (10.4 to 65.0)	26.7 (9.6 to 59.2)
Bilateral uveitis, %	14 (77.8%)	125 (88.0%)	7 (87.5%)
Eye-specific characteristics			
No. of affected eyes	32	270	15
Ocular findings, % affected eyes			
Any ocular complication	13 (40.6%)	164 (60.7%)	3 (20%)
Posterior synechiae	4 (12.5%)	22 (8.2%)	0 (0.0%)
Retinal vasculitis	0 (0.0%)	59 (21.8%)	0 (0.0%)

Ocular Inflammation in Behçet Disease: Incidence of Ocular Complications and of Loss of Visual Acuity

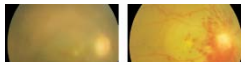
R. OKTAY KAÇMAZ, JOHN H. KEMPEN, CRAIG NEWCOMB, SAPNA GANGAPUTRA, EBENEZER DANIEL, GRACE A. LEVY-CLARKE, ROBERT B. NUSSENBLATT, JAMES T. ROSENBAUM, ERIC B. SUHLER, JENNIFER E. THORNE, DOUGLAS A. JABS, AND C. STEPHEN FOSTER, ON BEHALF OF THE SYSTEMIC IMMUNOSUPPRESSIVE THERAPY FOR EYE DISEASES COHORT STUDY GROUP

• CONCLUSIONS: Loss of VA and occurrence of ocular complications were common in patients with ocular inflammation associated with BD, even with aggressive therapy. Ongoing inflammation during follow-up, presence or occurrence of posterior synechiae, hypotony, and elevated IOP were associated with an increased risk of loss of VA.

Am J Ophthalmol 2008;146:828–836.



Infliximab Effects Compared to Conventional Therapy in the Management of Retinal Vasculitis in Behçet Disease



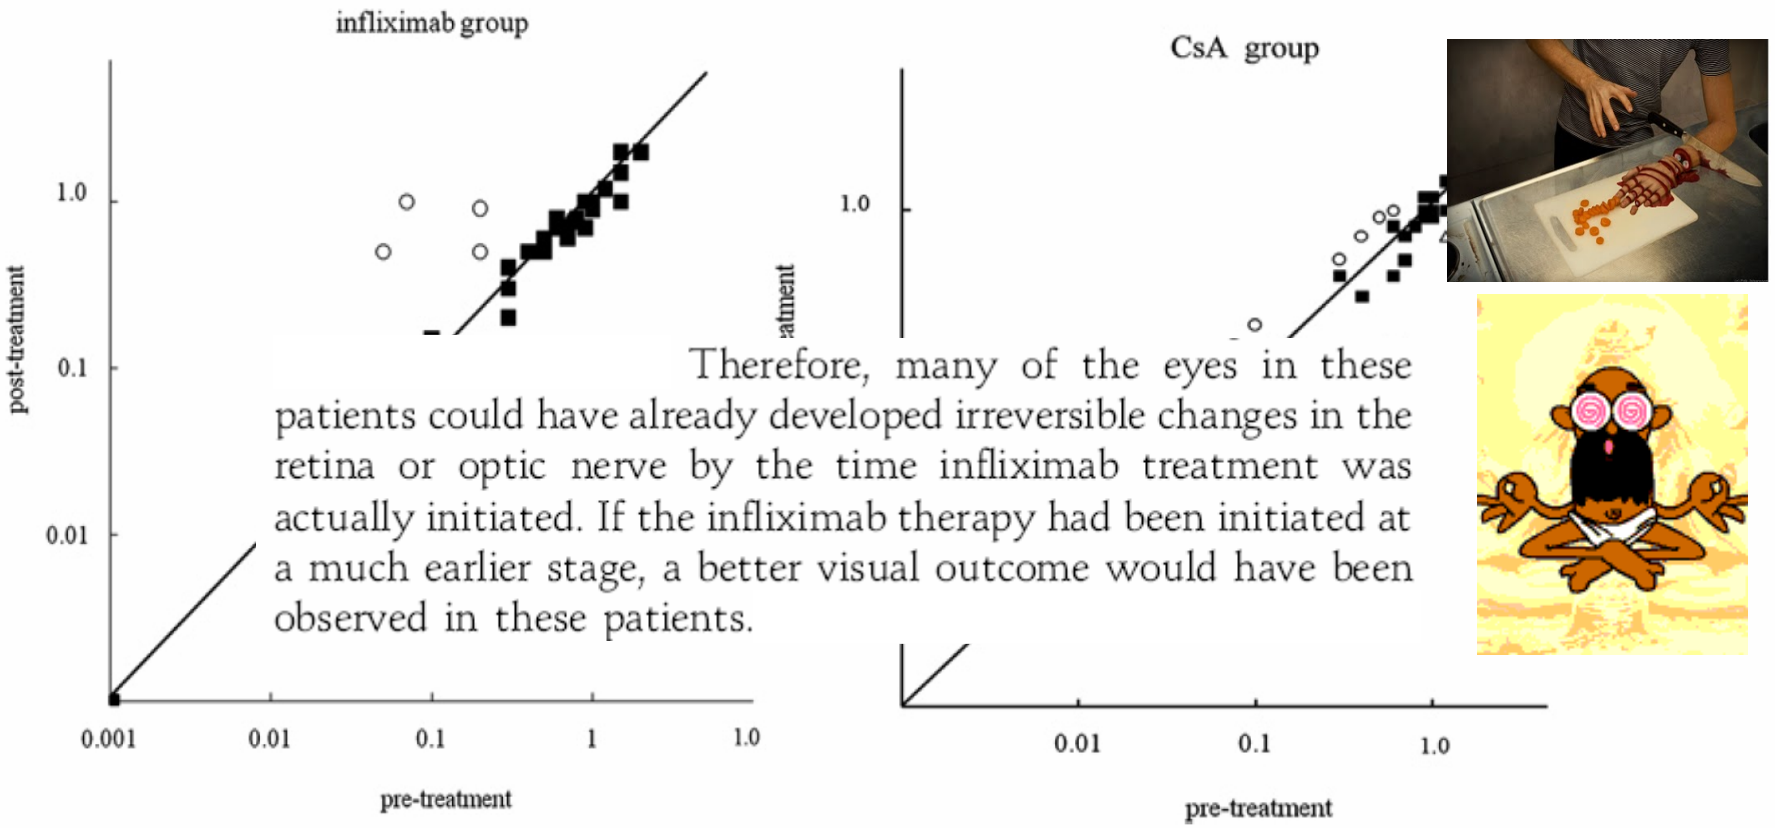
KHALID F. TABBARA AND AMAL I. AL-HEMIDAN

• CONCLUSIONS: Patients with Behçet disease had significant decrease in inflammation, improvement of visual acuity, and reduced ocular complications following infliximab when compared to conventional therapy. The number of relapses was less in the infliximab treatment group than the conventional therapy group.

Am J Ophthalmol 2008;146:845–850.

Table 1 Characteristics of patients with Behçet disease treated with infliximab (IFX)

Case	Age (years)	Sex	Interval between onset and infliximab (months)	Treatment before IFX administration	No of acute uveitis attacks		Concomitant treatment with IFX	Reason for conversion to IFX
					Before IFX	After IFX		
1	27	M	16	CsA	3	1	None	Resistance to CsA
2	32	M	60	CsA, PSL (0–30 mg)	6	0	None	Resistance to CsA
3	33	M	83	CsA, Col, PSL (5 mg)	5	0	Col	Resistance to CsA
4	39	M	70	CsA	5	0	None	Resistance to CsA
5	44	M	86	CsA	3	0	None	Resistance to CsA
6	63	M	72	PSL (15 mg)	0	0	PSL (12.5–15 mg)	Side effect of existent treatment
7	52	M	70	Col	1	0	None	Side effect of existent treatment
8	39	M	42	Az, Col, PSL (10 mg)	6	0	None	Side effect of existent treatment
9	42	M	110	CsA, PSL (10 mg)	0	0	PSL (9–10 mg)	Due to glaucoma operation
10	33	F	21	CsA, Col	3	0	None	Resistance to CsA
11	26	M	13	CsA, PSL (11 mg)	0	0	PSL (8–11 mg)	Resistance to CsA
12	34	M	21	CsA	3	0	None	Resistance to CsA
13	34	M	98	CsA	10	0	None	Resistance to CsA
14	40	M	16	Col, PSL (10 mg)	3	1	PSL (5–7.5 mg)	Resistance to existent treatment
15	26	F	31	CsA, PSL (10 mg)	0	0	PSL (5–10 mg)	Side effect of CsA
16	50	M	16	Col	2	0	Col	Resistance to Col
17	25	M	24	CsA	2	4	CsA	Resistance to CsA



e 2 Visual acuity changes seen for each therapy. Best-corrected visual acuity (BCVA) was measured at the initiation point and 6 months after the istration. With infliximab, the vision improved or was unchanged in 97% of the eyes, compared with 93% in the CsA group. Open circle, more than nes of improvement; black square, unchanged; open triangle, a decrease of less than two lines. Statistical analysis was performed using the —Whitney U test.

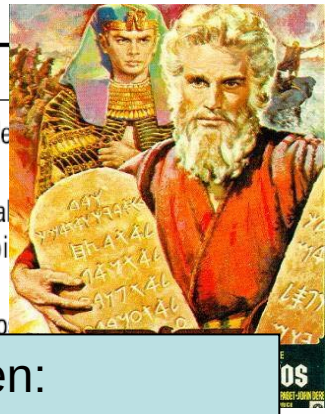
Table 3 Nine recommendations on Behçet disease (BD) that were developed after two anonymous Delphi rounds

No.	Recommendation
1	Any patient with BD and inflammatory eye disease affecting the posterior segment should be on a treatment regime that include corticosteroids.
2	If the patient has severe eye disease defined as >2 lines of drop in visual acuity on a 10/10 scale and/or retinal disease (retinal involvement), it is recommended that either ciclosporine A or infliximab be used in combination with azathioprine and corticosteroi without corticosteroids could be used instead.
3	There is no firm evidence to guide the management of major vessel disease in BD. For the management of acute deep vein thrombo
4	the
5	
6	
7	ids,
8	Ciclosporine A should not be used in BD patients with central nervous system involvement unless necessary for intraocular inflammation.
9	The decision to treat skin and mucosa involvement will depend on the perceived severity by the doctor and the patient. Mucocutaneous involvement should be treated according to the dominant or codominant lesions present.
	Topical measures (ie, local corticosteroids) should be the first line of treatment for isolated oral and genital ulcers.
	Acne-like lesions are usually of cosmetic concern only. Thus, topical measures as used in acne vulgaris are sufficient.
	Colchicine should be preferred when the dominant lesion is erythaema nodosum.
	Leg ulcers in BD might have different causes. Treatment should be planned accordingly.
	Azathioprine, IFNα and TNFα antagonists may be considered in resistant cases.



Usarás ANTI-TNF sobre todas las cosas en los pacientes con Behçet en:

- UVEITIS GRAVE, con afectación de la AGUDEZA VISUAL
- VASCULITIS RETINIANA
- afectación MACULAR
- fracaso o intolerancia a ciclosporina A

RECOMENDACIONES PARA EL USO DE TERAPIA ANTI-TNF EN LA ENFERMEDAD DE BEHÇET

11/F/46	BSCR	Posterior
12/M/28	VKH	Panuveítis
13/M/25	Idiopathic	Intermediate
14/M/36	Idiopathic	Posterior
15/F/39	Idiopathic	Posterior
16/F/27	Idiopathic	Anterior
17/F/32	Crohn disease	Panuveítis
18/F/37	Idiopathic	Panuveítis
19/M/29	Idiopathic	Panuveítis

TABLE 4. SUMMARIZED DATA FROM OUTCOME VARIABLES

	Visual acuity (logMar) mean ± SD[a]	*AC inflammation mean ± SD*[b]	*VC inflammation mean ± SD*[b]	*Macular thickness (μ) mean ± SD*[a]	*Immunosuppression load mean ± SD*[a]
Week 0	+0.35 ± 0.24	1.05 ± 1	1.8 ± 1	389 ± 164	10.1 ± 3.1
Month 12	+0.13 ± 0.18	0.07 ± 0.2	0.1 ± 0.4	241 ± 64	2.6 ± 1.8

Conclusions: Adalimumab seems to be an effective, safe therapy for the management of refractory uveitis and may provide the possibility to reduce the concomitant immunosuppressive drugs in these patients. Further long-term studies are warranted to determine the safety and efficacy of adalimumab in treating intraocular inflammation.

Acne-like lesions are usually of cosmetic concern

Colchicine should be preferred when the dominant

Leg ulcers in BD might have different causes. Tre

Azathioprine, IFNα and TNFα antagonists may be considered in resistant cases.

TABLE 1. Recommendations for the prescription of anti-TNF agents in BD

Subset	New manifestation	Recurrent/refractory cases
Parenchymal CNS involvement	Not recommended	In patients refractory to treatment with pulse cyclophosphamide and prednisolone (1 mg/kg/day), or in those who relapse while on maintenance with AZA[b] and prednisolone (<7.5 mg/day) infliximab[c] may be tried
Intestinal inflammation	Not recommended	In patients that have failed two immunosuppressive agents[b] and require prednisolone at a dosage >7.5 mg/day, Infliximab[c] may be used
Major vessel involvement	Not enough data	Not enough data
Mucocutaneous manifestations	Not recommended	In patients with poor quality of life despite, or intolerant to, adequate doses[b] of AZA, colchicine or thalidomide and require prednisolone at a dosage >7.5 mg/day, etanercept[d] or Infliximab[c] may be used

Adalimumab en el tratamiento de la enfermedad de Behçet

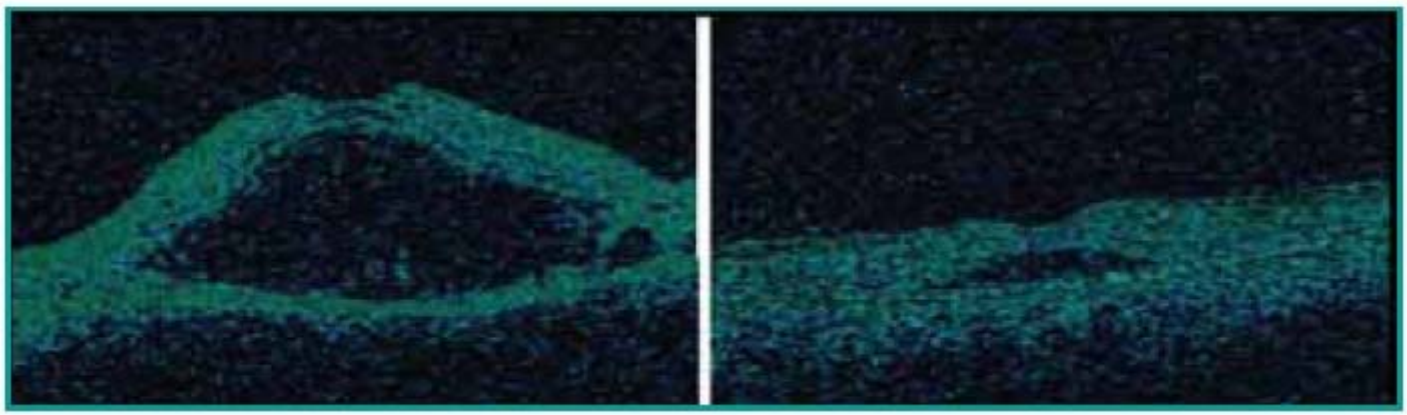
Adalimumab Therapy for Refractory Uveitis: A Pilot Study

MANUEL DIAZ-LLOPIS,[1–3] SALVADOR GARCÍA-DELPECH,[1] DAVID SALOM,[1] PATRICIA UDAONDO,[1] MARISA HERNÁNDEZ-GARFELLA,[1] ARTURO QUIJADA,[1] and F. JAVIER ROMERO[2,4]



Patient no./ sex/age, year	*Diagnosis*	*Anatomic location*
1/F/24	Idiopathic	Posterior
2/M/34	Behçet disease	Panuveítis
3/M/41	Sarcoidosis	Panuveítis
4/F/54	BSCR	Posterior
5/M/35	Behçet disease	Panuveítis
6/M/28	Behçet disease	Panuveítis
7/F/42	Idiopathic	Panuveítis
8/F/26	Idiopathic	Intermediate
9/M/42	Idiopathic	Intermediate
10/M/35	VKH	Panuveítis
11/F/46	BSCR	Posterior
12/M/28	VKH	Panuveítis
13/M/25	Idiopathic	Intermediate
14/M/36	Idiopathic	Posterior
15/F/39	Idiopathic	Posterior
16/F/27	Idiopathic	Anterior
17/F/32	Crohn disease	Panuveítis
18/F/37	Idiopathic	Panuveítis
19/M/29	Idiopathic	Panuveítis

TABLE 4. SUMMARIZED DATA FROM OUTCOME VARIABLES

	Visual acuity (logMar) mean ± SD[a]	*AC inflammation mean ± SD*[b]	*VC inflammation mean ± SD*[b]	*Macular thickness (μ) mean ± SD*[a]	*Immunosuppression load mean ± SD*[a]
Week 0	+0.35 ± 0.24	1.05 ± 1	1.8 ± 1	389 ± 164	10.1 ± 3.1
Month 12	+0.13 ± 0.18	0.07 ± 0.2	0.1 ± 0.4	241 ± 64	2.6 ± 1.8

Conclusions: Adalimumab seems to be an effective, safe therapy for the management of refractory uveitis and may provide the possibility to reduce the concomitant immunosuppressive drugs in these patients. Further long-term studies are warranted to determine the safety and efficacy of adalimumab in treating intraocular inflammation.

Adalimumab Therapy for Refractory Uveitis: A Pilot Study

José Luis Callejas-Rubio,[1] Daniel Sánchez-Cano,[1]
José Luis García Serrano,[2] and Norberto Ortego-Centeno[1]

Sex/age	*Diagnosis*	*Previous immunosuppressive therapy*	*Duration of treatment (months)*	*Relapses*
F/65	Panuveitis and Behçet	Prednisone, methotrexate, cyclosporine A	26	No
V/53	Panuveitis and Behçet	Prednisone, methotrexate, cyclosporine, etenercept	12	No
V/36	Panuveitis and Ankylosing spondylitis	Prednisone, methotrexate	24	No
F/46	Recurrent tridocyclitis	Prednisone, methotrexate	4	Yes
F/44	Posterior uveitis and bird-shot chorioretinopathy	None	6	No
V/38	Idiopathic panuveitis with retinal vasculitis	Prednisone, methotrexate, cyclosporine	8	Yes

Table 3 Nine recommendations on Behçet disease (BD) that were developed after two anonymous Delphi rounds

No.	Recommendation
1	Any patient with BD and inflammatory eye disease affecting the posterior segment should be on a treatment regime that includes a corticosteroids.
2	If the patient has severe eye disease defined as >2 lines of drop in visual acuity on a 10/10 scale and/or retinal disease (retinal va involvement), it is recommended that either ciclosporine A or infliximab be used in combination with azathioprine and corticosteroids; without corticosteroids could be used instead.
3	There is no firm evidence to guide the management of major vessel disease in BD. For the management of acute deep vein thrombosis agents such as corticosteroids, azathioprine, cyclophosphamide or ciclosporine A are recommended. For the management of pulmon aneurysms, cyclophosphamide and corticosteroids are recommended.
4	the
5	e,
6	
7	oids,
8	Ciclosporine A should not be used in BD patients with central nervous system involvement unless necessary for intraocular inflammation.
9	The decision to treat skin and mucosa involvement will depend on the perceived severity by the doctor and the patient. Mucocutaneous involvement should be treated according to the dominant or codominant lesions present.
	Topical measures (ie, local corticosteroids) should be the first line of treatment for isolated oral and genital ulcers.
	Acne-like lesions are usually of cosmetic concern only. Thus, topical measures as used in acne vulgaris are sufficient.
	Colchicine should be preferred when the dominant lesion is erythaema nodosum.
	Leg ulcers in BD might have different causes. Treatment should be planned accordingly.
	Azathioprine, IFNα and TNFα antagonists may be considered in resistant cases.

Usarás ANTI-TNF en casos de afectación mucocutánea:
-En casos resistentes
-En casos graves

- Afectación Gastrointestinal:
  - no hay tratamientos basados en la evidencia
  - sulfasazalina, azatioprina, talidomida o anti-TNF alfa deberían ser usados antes de la cirugía

-Afectación SNC:
  - no hay estudios controlados
  - pueden usarse IFN, azatioprina, ciclofosfamida, metotrexate o anti TNF alfa
