Hospital 12 de Octubre

INTRODUCCIÓN

- La fibrilación auricular no valvular es una arritmia frecuente, cuya incidencia aumenta con la edad.
- La fibrilación auricular es la causa de alrededor del 20% de los ictus isquémicos.
- La anticoagulación, ha demostrado reducir los eventos cardioembólicos a costa de incrementar el riesgo de hemorragias.
- Aproximadamente una tercera parte de estos pacientes no pueden recibir anticoagulantes, por el riesgo de sangrado.

INTRODUCCIÓN

- Los dispositivos de cierre de la orejuela izquierda representan una alternativa a la anticoagulación, en aquellos pacientes en los que está contraindicada o tienen alto riesgo de sangrado.
- Score HAS-BLED (hipertensión arterial, función renal /hepática alterada, ictus, antecedentes de hemorragia o predisposición al sangrado, labilidad en el INR, edad >65 años, toma concomitante de fármacos o alcohol).

ESCALA DE RIESGO EMBÓLICO

CHA_2DS_2-VASc

Risk factor-based approach expressed as a point based scoring system, with the acronym CHA_2DS_2-VASc *(Note: maximum score is 9 since age may contribute 0, 1, or 2 points)*

Risk factor	Score
Congestive heart failure/LV dysfunction	1
Hypertension	1
Age ≥ 75	2
Diabetes mellitus	1
Stroke/TIA/thrombo-embolism	2
Vascular disease[a]	1
Age 65–74	1
Sex category (i.e. female sex)	1
Maximum score	**9**

ESCALA DE RIESGO HEMORRÁGICO

HAS-BLED

Clinical characteristics comprising the HAS-BLED bleeding risk score

Letter	Clinical characteristic[a]	Points awarded
H	Hypertension	1
A	Abnormal renal and liver function (1 point each)	1 or 2
S	Stroke	1
B	Bleeding	1
L	Labile INRs	1
E	Elderly (e.g. age > 65 years)	1
D	Drugs or alcohol (1 point each)	1 or 2
		Maximum 9 points

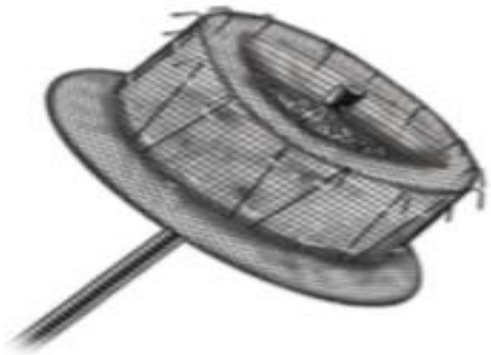
INTRODUCCIÓN

- La orejuela izquierda es un remanente embriológico, cuya principal función es el control de la volemia.
- Gran variabilidad anatómica de un paciente a otro, habitualmente más de un lóbulo.
- En la fibrilación auricular, la orejuela izquierda pierde su capacidad contráctil, dilatándose y produciéndose un enlentecimiento de la sangre, con el consecuente aumento del riesgo de trombosis.
- El 91% de los trombos localizados en la aurícula izquierda, se encuentran alojados en la orejuela izquierda.

DISPOSITIVOS

- PLAATO. Retirado del mercado.
- Sistema Watchman (Boston Scientific; Boston. Massachusetts. Estados Unidos).
- Amplatzer Cardiac Plug (ACP) (St. Jude Medical; Minneapolis, Minnesota, Estados Unidos). Variante Amulet.
- Se implantan por vía transeptal a través de la vena femoral.
- El sistema Watchman se implanta a 10 mm del ostium de la OI, sin llegar a cubrirla.

AMPLATZER



Feature	ACP								Amulet							
Sizes (mm)	16	18	20	22	24	26	28	30	16	18	20	22	25	28	31	34
Disc Diameter	Lobe + 4 mm				Lobe + 6 mm				Lobe + 6 mm				Lobe + 7 mm			
Lobe Length	6.5 mm								7.5 mm				10 mm			
Waist Length	4 mm								5.5 mm				8 mm			
Sheath Diameter	9Fr	10Fr			13Fr				12Fr						14Fr	
Stabilizing Wires	6 pairs								6 pairs		8 pairs		10 pairs

TVLA1

TVLA2

FIGURE 3 ACP and Amulet Characteristics and Available Sheaths

ACP = Amplatzer Cardiac Plug; Fr = French.

WATCHMAN

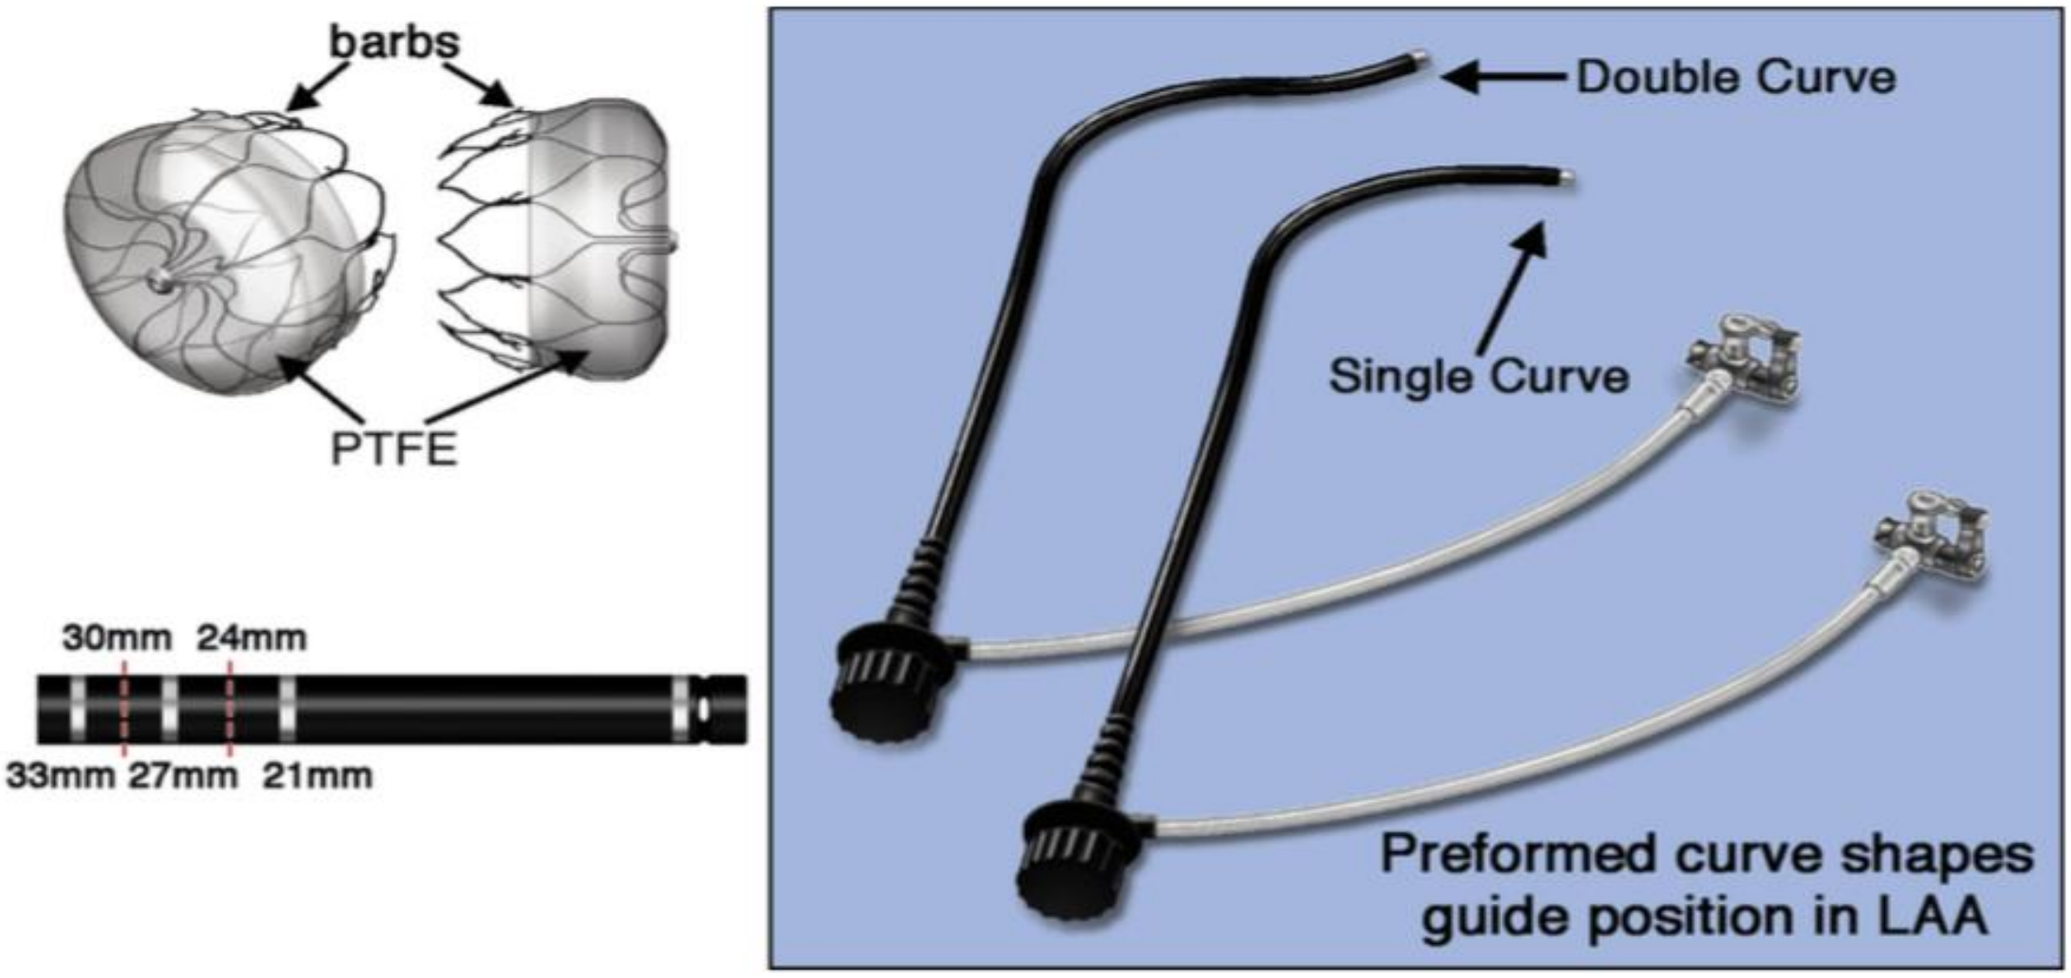

FIGURE 1 WATCHMAN and 14-F Access Sheaths (Double- and Single-Curve)

There are 3 radio-opaque marker bands (33, 27, and 21 mm) on the distal sheath, which should be aligned to the left atrial appendage (LAA) "ostium" according to the selected device. PTFE = polyethylene terephthalate.

IMPLANTACIÓN

- EL implante de ambos dispositivos, requiere de una curva de aprendizaje no despreciable.
- Antes del implante requiere de un estudio con ETE en la mayoría de los casos para visualizar y estudiar anatómicamente la orejuela izquierda, descartando trombos intracavitarios. TC en ocasiones.
- Se desconoce la importancia de hallar fugas periprotésicas durante el seguimiento, aunque se recomienda implantar dispositivos algo mayores que el tamaño de la orejuela, para evitarlas.

TERAPIA ANTITROMBÓTICA

- En el estudio PROTECT-AF se administraba warfarina durante 45 días y se suspendía según los hallazgos tras ETE.

- Actualmente la mayoría de centros recomiendan doble antiagregación con ASA y clopidogrel durante 1-3 meses.

- Posteriormente se recomienda antiagregación con un solo fármaco, de forma indefenida.

COMPLICACIONES

- Derivadas del implante o periprocedimiento: derrame pericárdico, taponamiento cardiaco, ictus isquémico, embolización del dispositivo, implante exitoso.

- Similar tasa de complicaciones para ambos dispositivos, en equipos con experiencia. Ictus < 0.5%, derrame pericárdico 1-2%, embolización dispositivo 0.5-1%.

- Durante el seguimiento: fugas periprotésicas, trombosis del dispositivo.

GUÍAS CLÍNICAS

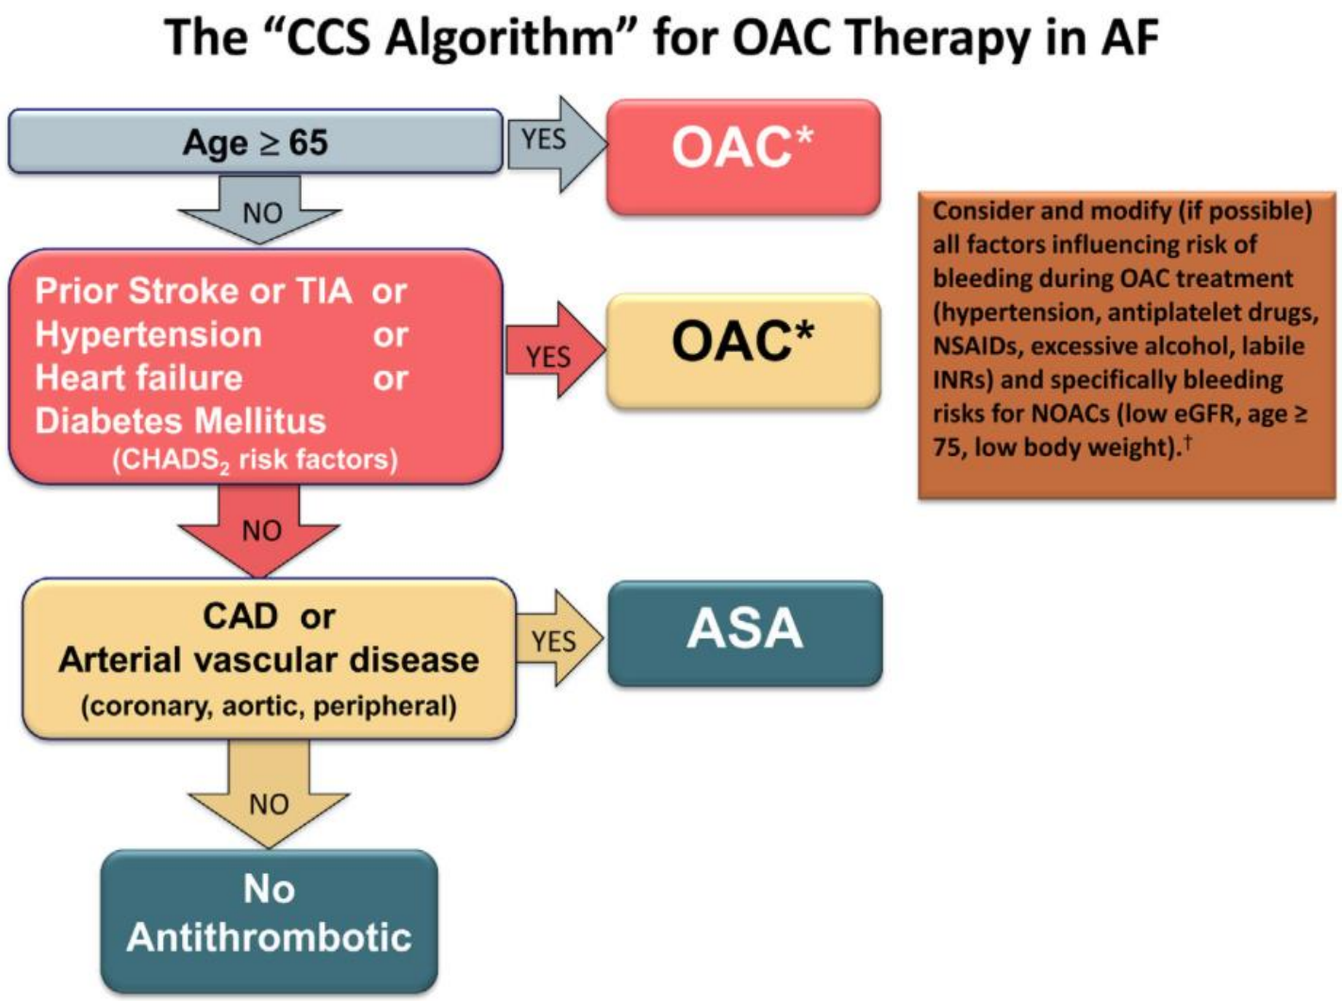

Figure 1. The simplified "CCS algorithm" for deciding which patients with atrial fibrillation (AF) or atrial flutter (AFL) should receive oral anti-coagulation (OAC) therapy. * We suggest that a NOAC be used in preference to warfarin for non-valvular AF. † Might require lower dosing. ASA, acetylsalicylic acid; CAD, coronary artery disease; CCS, Canadian Cardiovascular Society; $CHADS_2$, **C**ongestive Heart Failure, **H**ypertension, **A**ge, **D**iabetes, **S**troke/Transient Ischemic Attack; eGFR, estimated glomerular filtration rate; INR, international normalized ratio; NOAC, novel oral anticoagulant; NSAID, nonsteroidal anti-inflammatory drug; TIA, transient ischemic attack.

GUÍAS CLÍNICAS

RECOMMENDATION

5. We recommend that when OAC therapy is indicated for patients with nonvalvular AF, most patients should receive dabigatran, rivaroxaban, apixaban, or edoxaban (when approved) in preference to warfarin (Strong Recommendation, High-Quality Evidence)

RECOMMENDATION

11. We suggest these nonapproved LAA closure devices not be used, except in research protocols or in systematically documented use protocols in patients at high risk of stroke ($CHADS_2$ score ≥ 2) for whom antithrombotic therapy is precluded (Conditional Recommendation, Low-Quality Evidence).

Stroke

Percutaneous Left Atrial Appendage Closure for Stroke Prophylaxis in Patients With Atrial Fibrillation

2.3-Year Follow-up of the PROTECT AF (Watchman Left Atrial Appendage System for Embolic Protection in Patients With Atrial Fibrillation) Trial

Vivek Y. Reddy, MD; Shephal K. Doshi, MD; Horst Sievert, MD; Maurice Buchbinder, MD; Petr Neuzil, MD, PhD; Kenneth Huber, MD; Jonathan L. Halperin, MD; David Holmes, MD; on behalf of the PROTECT AF Investigators

Background—The multicenter PROTECT AF study (Watchman Left Atrial Appendage System for Embolic Protection in Patients With Atrial Fibrillation) was conducted to determine whether percutaneous left atrial appendage closure with a filter device (Watchman) was noninferior to warfarin for stroke prevention in atrial fibrillation.

Methods and Results—Patients (n=707) with nonvalvular atrial fibrillation and at least 1 risk factor (age >75 years, hypertension, heart failure, diabetes, or prior stroke/transient ischemic attack) were randomized to either the Watchman device (n=463) or continued warfarin (n=244) in a 2:1 ratio. After device implantation, warfarin was continued for ≈45 days, followed by clopidogrel for 4.5 months and lifelong aspirin. Study discontinuation rates were 15.3% (71/463) and 22.5% (55/244) for the Watchman and warfarin groups, respectively. The time in therapeutic range for the warfarin group was 66%. The composite primary efficacy end point included stroke, systemic embolism, and cardiovascular death, and the primary analysis was by intention to treat. After 1588 patient-years of follow-up (mean 2.3±1.1 years), the primary efficacy event rates were 3.0% and 4.3% (percent per 100 patient-years) in the Watchman and warfarin groups, respectively (relative risk, 0.71; 95% confidence interval, 0.44%–1.30% per year), which met the criteria for noninferiority (probability of noninferiority >0.999). There were more primary safety events in the Watchman group (5.5% per year; 95% confidence interval, 4.2%–7.1% per year) than in the control group (3.6% per year; 95% confidence interval, 2.2%–5.3% per year; relative risk, 1.53; 95% confidence interval, 0.95–2.70).

Conclusions—The "local" strategy of left atrial appendage closure is noninferior to "systemic" anticoagulation with warfarin. PROTECT AF has, for the first time, implicated the left atrial appendage in the pathogenesis of stroke in atrial fibrillation.

Clinical Trial Registration:—URL: http://www.clinicaltrials.gov. Unique identifier: NCT00129545. (***Circulation.* 2013;127:720-729.**)

Key Words: anticoagulation ■ atrial fibrillation ■ catheters ■ left atrial appendage ■ pericardial effusion ■ stroke prevention ■ warfarin

ESTUDIO PROTECT-AF

- Único estudio aleatorizado que ha comparado antgonistas de la vitamina K (warfarina) con un dispositivo oclusor de la orejuela izquierda (Watchman) en la fibrilación auricular no valvular.
- Demostró que el cierre de la orejuela izquierda no es inferior a la warfarina en el objetivo primario: combinado de ictus, embolia sistémica o muerte de origen cardiovascular).
- Tasa inicial de complicaciones periprocedimiento iniciales altas.

RESUMEN

Introducción y objetivos: El cierre del apéndice auricular izquierdo puede ser una opción terapéutica atractiva para pacientes con fibrilación auricular no valvular y contraindicación para tomar anticoagulantes orales, siempre que se obtengan buenos resultados durante la implantación y en el seguimiento.
Métodos: Se analizó a 35 pacientes consecutivos y no elegibles para los estudios aleatorizados con anticoagulantes orales a los que se implantó el dispositivo oclusor Amplatzer. Tras los primeros 5 casos, se incorporó una técnica de imagen 3D. Se analizaron los resultados de la implantación y de seguimiento durante 1 año.
Resultados: La media de edad era 74,65 ± 7,61 años, con un $CHADS_2$ de 2,41 ± 1,53 y un CHA_2DS_2-VASc de 3,17 ± 1,60. No se pudo implantar el dispositivo en 1 caso y en 5 fue necesario cambiar la medida seleccionada. No hubo ninguna complicación cardiaca durante la implantación ni durante la estancia hospitalaria. Hubo una complicación vascular (fístula arteriovenosa). Se realizó seguimiento con ecocardiografía transesofágica a las 24 h y tras 1, 3, 6 y 12 meses; se documentaron 5 trombos, que se resolvieron con heparina. En el seguimiento de 21,14 ± 10,09 meses, hubo 3 muertes de pacientes mayores de 80 años, ninguna de ellas cardiológica, y un accidente isquémico transitorio sin secuelas.
Conclusiones: El cierre del apéndice auricular izquierdo por un operador con cierta experiencia puede ser una opción terapéutica con pocas complicaciones y con resultados a más de 1 año eficaces en la reducción de complicaciones tromboembólicas y hemorrágicas, incluso en poblaciones de muy alto riesgo.

ABSTRACT

Aims The aim of this study was to observe the percentage of thromboembolic and haemorrhagic events over a 2-year follow-up in patients with non-valvular atrial fibrillation (NVAF) undergoing closure of the left atrial appendage (LAA) with an occlusion device.

Observed events and $CHADS_2$ (congestive heart failure, hypertension, age, diabetes, stroke history), CHA_2DS_2-VASc (also adding: vascular disease and sex) and HAS-BLED (hypertension, abnormal liver/renal function, stroke history, bleeding predisposition, labile international normalised ratios, elderly, drugs/alcohol use)-predicted

(INR) monitoring) are interesting, the risks inherent to their anticoagulant action remain unchanged, and they significantly increase the cost of surgery. The relative reduction in the number of events is striking but less relevant in absolute terms.[1]

Closure of the left atrial appendage (LAA), the site of over 90% of thrombi in these patients, has initially been shown to reduce incidence of intracranial haemorrhage. It is at least as effective as warfarin in reducing thromboembolic events,[2] but might be superior to warfarin in longer follow-up periods.[3 4] LAA occlusion is now starting to appear

CONCLUSIONES

- La evidencia científica actual sugiere que el cierre percutáneo de la orejuela izquierda es eficaz en la reducción de eventos tromboembólicos en la fibrilación auricular no valvular.
- Tasa de complicaciones periprocedimiento baja, aunque significativa, muy relacionada con la curva de aprendizaje. Centros con disponibilidad de cirugía cardiaca.
- Selección de pacientes cuidadosa y multidisciplinar.

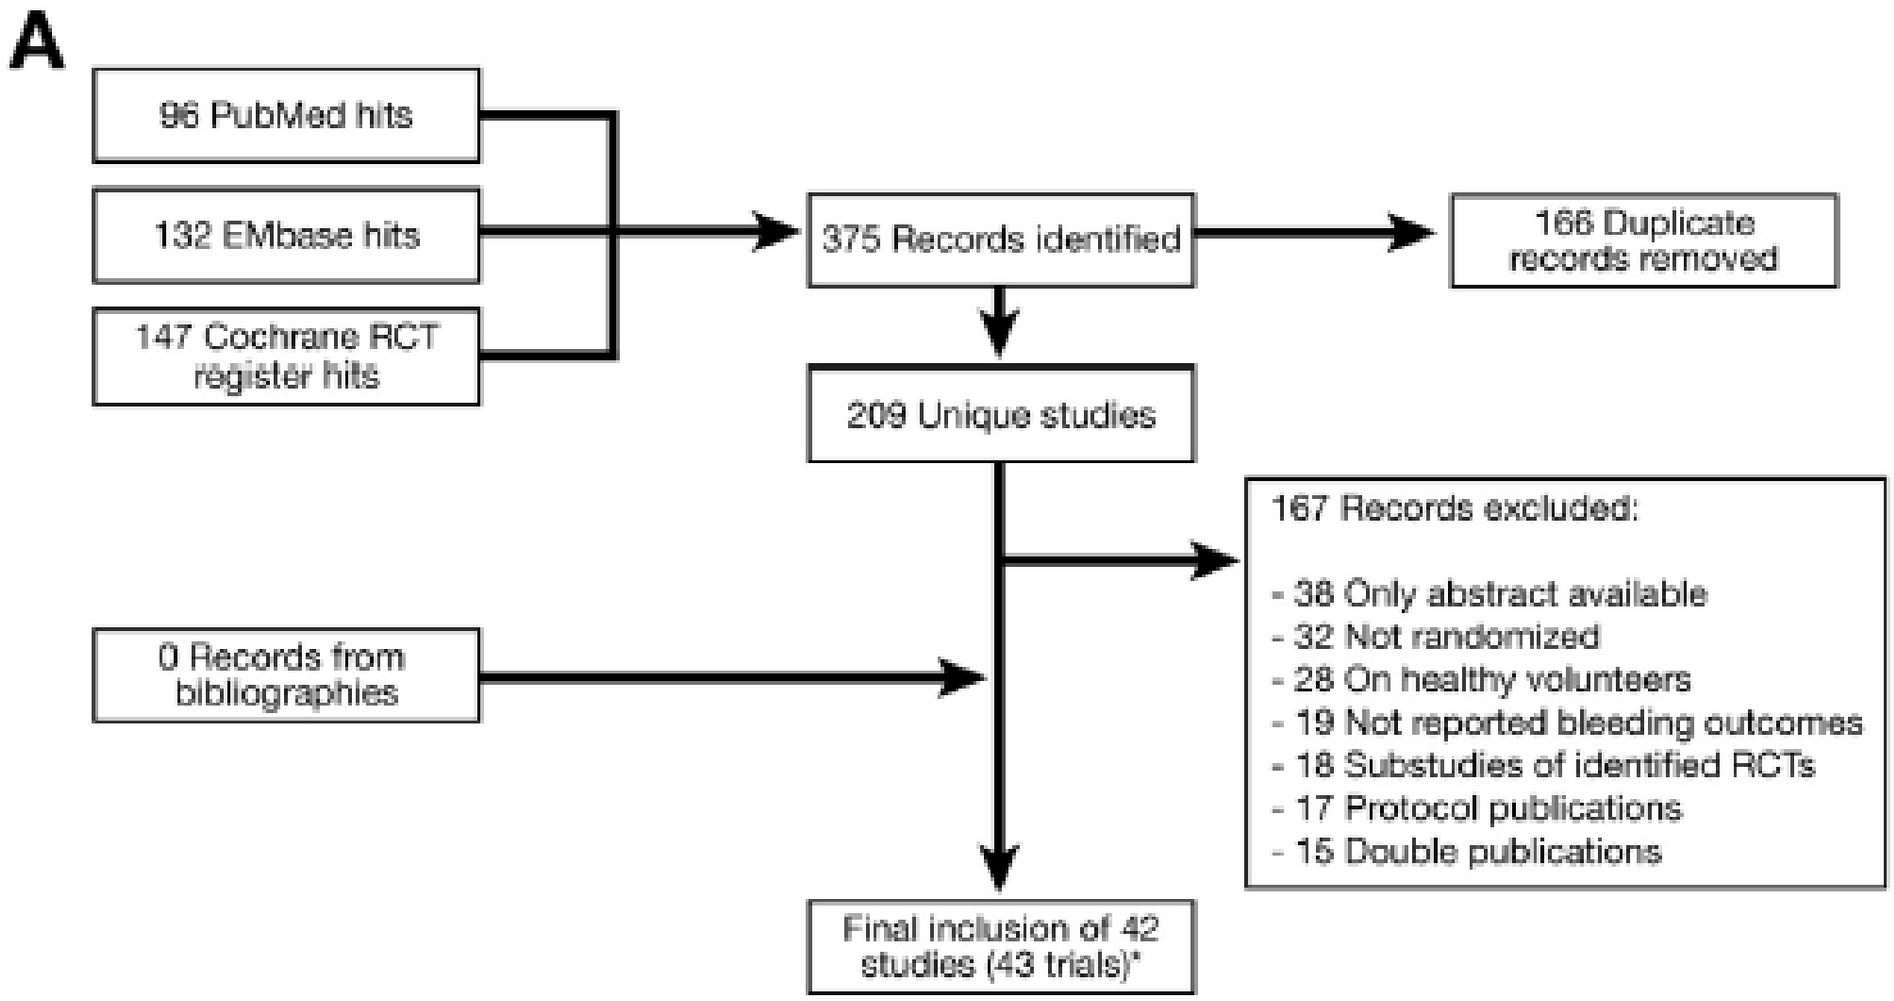
New Oral Anticoagulants Increase Risk for Gastrointestinal Bleeding: A Systematic Review and Meta-analysis

I. LISANNE HOLSTER,[1] VERA E. VALKHOFF,[1] ERNST J. KUIPERS,[1,2] and ERIC T. T. L. TJWA[1]

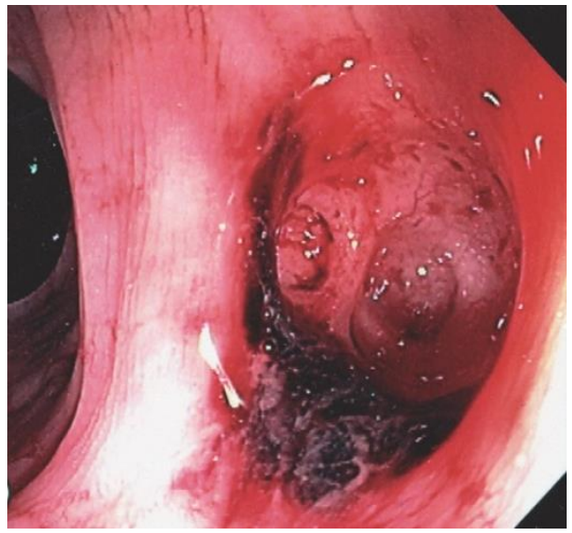
[1]*Department of Gastroenterology and Hepatology, and* [2]*Department of Internal Medicine, Erasmus MC University Medical Centre, Rotterdam, The Netherlands*

GASTROENTEROLOGY 2013;145:105–112



The role of anticoagulant & GI bleeding

- **Anticoagulants do not cause any lesion in the GI tract.**
- **However, anticoagulants are associated with a higher risk of bleeding from most lesions**



Recorded Drug Use	Peptic Ulcer Bleeding (N=1218)	Diverticular Bleeding (N=189)	Angiodysplasia (N=66)
NSAID	**30.7%**	**14.8%**	**16.7%**
LOW DOSE ASA	**15.8%**	**21.7%**	**6.1%**
Anticoagulant	**5.7%**	**14.3%**	**27.3%**

- **Occult GI bleeding and anticoagulants: 4 times higher**

CASO CLÍNICO

- Varón de 84 años. Hipertensión arterial. Diabetes mellitus tipo 2 en tratamiento con insulina y antidiabéticos orales.
- Ictus isquémico en territorio vertebrobasilar sin secuelas, de presumible etiología cardioembólica.
- Fibrilación auricular persistente no valvular anticoagulada con antagonistas de la vitamina k.
- Episodios de hemorragia digestiva grave, en forma de melenas, con necesidad de transfusión de hemoderivados.

CASO CLÍNICO

- El paciente tiene buena calidad de vida, con funciones corticales normales y buena clase funcional.
- Mantiene controles INR en rango.
- Estudio endoscópico: gastroscopia con hernia de hiato y gastritis crónica antral; colonoscopia con hallazgos de hemorroides internas y diverticulosis de colon no complicada.
- Cápsula-endoscopia: innumerables petequias de duodeno a yeyuno medio, que se asumen como responsables de los sangrados.

APROBACIÓN FDA

The Center for Devices and Radiological Health (CDRH) of the Food and Drug Administration (FDA) has completed its review of your premarket approval application (PMA) for the WATCHMAN LAA Closure Technology. This device is indicated to reduce the risk of thromboembolism from the left atrial appendage (LAA) in patients with non-valvular atrial fibrillation who:

- Are at increased risk for stroke and systemic embolism based on $CHADS_2$ or CHA_2DS_2-VASc scores and are recommended for anticoagulation therapy;
- Are deemed by their physicians to be suitable for warfarin; and
- Have an appropriate rationale to seek a non-pharmacologic alternative to warfarin, taking into account the safety and effectiveness of the device compared to warfarin.

We are pleased to inform you that the PMA is approved. You may begin commercial distribution of the device in accordance with the conditions of approval described below.
