Classification Criteria for Systemic Sclerosis Subsets

SINDHU R. JOHNSON, BRIAN M. FELDMAN, and GILLIAN A. HAWKER

J Rheumatol 2007;34:1855–63

Table 1. Classification of systemic sclerosis subsets.

Study	Classification Scheme	Number of Citations
Barnett[36]	3 subsets: limited, moderate, extensive, based on skin involvement of the fingers only, limbs and face, and involvement of the trunk, respectively	66
Ferri[30]	4 subsets: sine scleroderma SSc: absence of cutaneous involvement with visceral involvement, NC changes and autoantibodies; limited cutaneous: skin involvement of fingers with or without involvement of neck, face, and axillae; intermediate cutaneous: skin involvement of upper and lower limbs, neck and face without truncal involvement, diffuse cutaneous: distal and truncal skin involvement	52
Giordano[28]	6 subsets: I: sclerodactyly only; II: sclerodactyly and skin involvement of neck, lower eyelid, or axillae; III: skin involvement of hands and forearms ± legs ± face; IV: group III and arm and/or thigh skin involvement; V: group III and thorax; VI: group III and/or IV and/or V plus the abdomen	121
	3 subsets: limited: skin involvement of fingers, face, neck, axillae; intermediate: skin involvement proximal to fingers; diffuse: truncal skin involvement	121
Goetz[22]	2 subsets: acrosclerosis and diffuse: based on skin thickening limited to extremities or includes trunk	227
Holzmann[53]	5 subsets (Types I–IV) based on presence/absence of RP, sclerosis, extracutaneous manifestations, ANA	10
LeRoy[25]	2 subsets: diffuse cutaneous SSc: onset of RP within 1 year; truncal and acral skin involvement; tendon friction rubs; early incidence of ILD, renal failure, diffuse GI disease, myocardial involvement; absence of ACA, abnormal ND; limited cutaneous SSc: RP for years, skin involvement limited to hands, face, feet, forearms or absent; late incidence of PAH, trigeminal neuralgia, calcinosis, telangiectasia; high incidence of ACA, abnormal NC	877
LeRoy and Medsger[41]	4 subsets: limited SSc (LSSc) consists of (1) objective RP plus any one of NC changes or SSc selective autoantibodies OR (2) subjective RP plus both NC changes and SSc selective autoantibodies; limited cutaneous SSc (lcSSc): criteria for LSSc plus distal cutaneous changes; diffuse cutaneous (dcSSc): criteria for lcSSc plus proximal cutaneous changes; diffuse fasciitis with eosinophilia: proximal cutaneous changes without criteria for lSSc or lcSSc	46
Maricq[6]	6 subsets: diffuse, intermediate, digital, scleroderma sine scleroderma, undifferentiated connective tissue disease with scleroderma, CREST syndrome	3
Masi[43]	3 subsets: digital: skin involvement of fingers or toes but not proximal extremity or trunk; proximal extremity: proximal extremities or face but not trunk; truncal: thorax or abdomen	42
Rodnan[2]	3 subsets: classical disease involving skin of the trunk, face and proximal extremities, and early involvement of esophagus, intestine, heart, lung and kidney; CREST syndrome; and overlap syndromes including sclerodermatomyositis and mixed connective tissue disease	79
Scussel-Lonzetti[39]	4 subsets: normal skin, limited: skin involvement restricted to fingers, with RP, calcinosis, esophageal involvement and telangiectasia; intermediate: skin involvement of arms proximal to metacarpophalangeal but not trunk; diffuse: skin involvement of the trunk	1
Tuffanelli and Winkelmann[35]	2 subsets: acrosclerosis: RP, acral skin involvement; diffuse SSc: no RP, skin involvement beginning centrally	42
Winterbauer[23]	CREST syndrome: calcinosis, RP, sclerodactyly, telangiectasia	176

RP: Raynaud's phenomenon; NC: nailfold capillary; ILD: interstitial lung diseases; GI: gastrointestinal; ACA: anticentromere antibodies; PAH: pulmonary arterial hypertension; LSSc: limited SSc.

Esclerodermia: Clasificación en subtipos, *según LeRoy*

TABLE 1. Some features of the LeRoy *et al.* 1988 [4] and LeRoy and Medsger [17] subsets of SSc

Diffuse cutaneous scleroderma (dcSSc)
- History of Raynaud's with onset within 1 yr
- Skin sclerosis extending proximal to the elbow; may involve truncal areas
- Tendon friction rubs may occur
- Early onset of pulmonary, renal and diffuse gastrointestinal involvement
- Rarely anticentromere antibodies but often antitopoisomerase 1 antibodies
- Nailfold capillary destruction

Limited cutaneous scleroderma (lcSSc)
- Skin involvement restricted to hands, face, forearms and feet
- Delayed but often severe onset of pulmonary arterial hypertension

Ectopic calcinosis, telangiectasias
- Anticentromere antibodies common but antitopoisomerase 1 very rare
- Dilated nailfold caps seen but no capillary destruction

Limited/unclassifiable/pre-SSc
- Raynaud's phenomenon objectively documented as well as *either* abnormal widefield nailfold capillaroscopy *or* SSc-selective autoantibodies (anticentromere antibodies, anti-topiisomerase 1, antifibrillin, anti-PM-Scl, anti-RNA polyisomerase I or III)
- Raynaud's phenomenon subjectively documented as well as abnormal widefield capillaroscopy *and* SSc selective autoantibodies

2 subsets: diffuse cutaneous SSc: onset of RP within 1 year; truncal and acral skin involvement; tendon friction rubs; early incidence of ILD, renal failure, diffuse GI disease, myocardial involvement; absence of ACA, abnormal ND; limited cutaneous SSc: RP for years, skin involvement limited to hands, face, feet, forearms or absent; late incidence of PAH, trigeminal neuralgia, calcinosis, telangiectasia; high incidence of ACA, abnormal NC

ESCLEROSIS SISTEMICA: CLASIFICACION Y SUBTIPOS SEGUN UN ANALISIS DE LOS FACTORES PRONOSTICOS.

Carmen P. Simeón
Tesis Doctoral, 1991

3.- Establecer diferentes grupos pronósticos con determinadas características clínico-biológicas.

4.- Establecer una clasificación de la ES según el estudio descriptivo y el análisis de los factores pronósticos.

2.- La magnitud de la afección cutánea permite distinguir dos grupos de enfermos con características clínicas y pronósticas homogéneas: 1) **ES difusa:** esclerosis cutánea proximal a codos y rodillas. 2) **ES limitada:** esclerosis cutánea distal a codos y rodillas.

Línea Esclerodermia (GEAS)

Cutaneous SSc Subsets and Clinical-epidemiologic features of the 916 Spanish patients with SSc

Predomina la forma limitada

La relación mujer/varón es diferente entre los 2 subtipos

El tiempo que transcurre desde el comienzo de la enfermedad hasta el diagnóstico es mayor en la forma limitada

En la forma limitada sólo un 65,3% cumplen los Criterios ACR

Las afecciones osteomuscular, digestiva, pulmonar, cardíaca y renal predominan en la forma difusa, con algunas peculiaridades como la exclusividad de la cirrosis biliar primaria en la forma limitada

El porcentaje de mortalidad es mayor en la forma difusa

Disease manifestations	LcSSc (%)	DcSSc (%)	
Sicca Syndrome	211 (37.5)	30 (33)	ns
Death	66 (11.7)	63 (26)	< 0.0001

ACA positive	293 (58)[a]	17 (8.4)[b*c*]	27 (41.5)	19 (54.3)	356 (38.9)

Pre-esclerodermia

Predominan las mujeres

La edad de comienzo y la del diagnóstico son menores que las de los otros subtipos

El fenómeno de Raynaud está siempre presente y sólo ocasionalmente las otras manifestaciones

Los AANs son siempre positivos y en la mayoría ACA +

En la capilaroscopia predomina el patrón lento

SYSTEMIC SCLEROSIS SINE SCLERODERMA

Demographic, Clinical, and Serologic Features and Survival in Forty-Eight Patients

Poormoghim H et al. *Arthritis and Rheumatism*. 2000;43:444-51

Table 1. Summary of organ system involvement in 48 patients with systemic sclerosis sine scleroderma (ssSSc) and 507 patients with SSc and limited cutaneous involvement (lcSSc)*

Organ system involvement	ssSSc	lcSSc	*P*

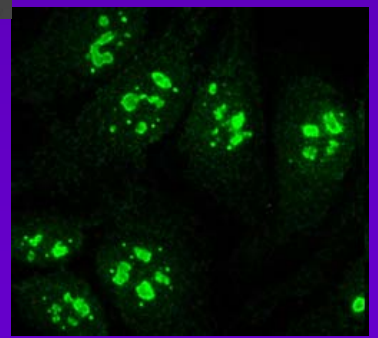
AANs específicos
Sin afección cutánea



Conclusion. Systemic sclerosis sine scleroderma should be included in the spectrum of SSc with limited cutaneous involvement and should not be considered a distinct or separate disorder.

RESULTS

STAT4 is associated with limited cutaneous SSc in the Spanish population

BANK1 Is a Genetic Risk Factor for Diffuse Cutaneous Systemic Sclerosis and Has Additive Effects With *IRF5* and *STAT4*

Diudé P et al. *Arthritis and Rheumatism*. 2009;60:3.447-454

Conclusion. Our results establish *BANK1* as a new SSc genetic susceptibility factor and show that *BANK1*, *IRF5*, and *STAT4* act with additive effects.

BANK1 functional variants are associated with susceptibility to diffuse systemic sclerosis in Caucasians

B Rueda, P Gourh, J Broen, S K Agarwal, C P Simeón, N Ortego-Centeno, M C Vonk, M Coenen, G Riemekasten, N Hunzelmann, R Hesselstrand, F K Tan, J D Reveille, S Assasi, F J Garcia-Hernandez, P Carreira, M Camps, A Fernandez-Nebro, P Garcia de la Peña, T Nearney, D Hilda, M A Gónzalez-Gay, P Airo, L Beretta, R Scorza, T RDJ Radstake, M Mayes, F C Arnett and J Martin

Ann Rheum Dis published online 8 Oct 2009;
doi:10.1136/ard.2009.118174

Conclusion: Our results suggest that *BANK1* gene confers susceptibility to SSc in general, and specifically to the dcSSc and anti-topoisomerase-I antibody subsets.

Prognostic Model Based on Nailfold Capillaroscopy for Identifying Raynaud's Phenomenon Patients at High Risk for the Development of a Scleroderma Spectrum Disorder

Ingegnoli F et al. *Arthritis and Rheumatism*. 2008;58:2.174-182

Table 2. Multivariate regression analysis of the 3 prognostically relevant capillaroscopy parameters*

Prognostic variable	HR	95% CI	χ^2	*P*
Giant loops	1.58	0.6–4.14	0.86	0.355
Microhemorrhages	1.77	0.79–3.95	1.93	0.164
No. of capillaries				
Linear	0.66	0.45–0.98	4.15	0.042
Nonlinear	1.66	1.01–2.70	4.06	0.044

* HR = hazard ratio; 95% CI = 95% confidence interval.

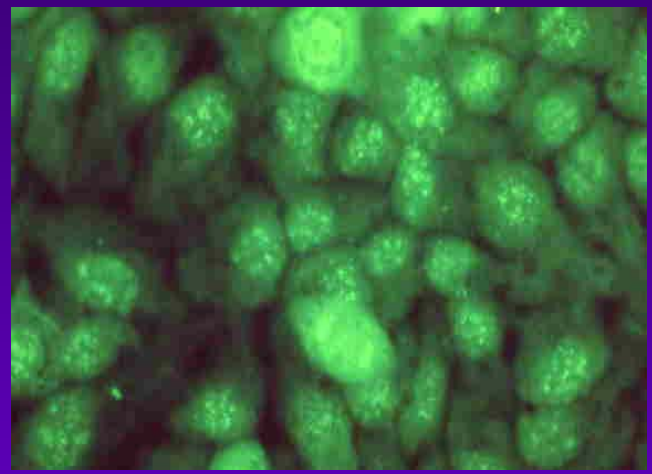
Conclusion. **Our prognostic capillaroscopic index identifies RP patients in whom the risk of developing SSDs is high. This model is a weighted combination of different capillaroscopy parameters that allows physicians to stratify RP patients easily, using a relatively simple diagram to deduce the prognosis. Our results suggest that this index could be used in clinical practice, and its further inclusion in prospective studies will undoubtedly help in exploring its potential in predicting treatment response.**

Autoantibodies and Microvascular Damage Are Independent Predictive Factors for the Progression of Raynaud's Phenomenon to Systemic Sclerosis

A Twenty-Year Prospective Study of 586 Patients, With Validation of Proposed Criteria for Early Systemic Sclerosis

Koenig M et al. *Arthritis and Rheumatism*. 2008;58:3.902-12

Last, this study is the first to validate the criteria for early SSc that were proposed by LeRoy and Medsger, but were not validated (21). According to these criteria, when the presence of RP is subjective only (i.e., by patient report only), as in the present study, early SSc may be diagnosed when *both* an SSc pattern on NCM and SSc-specific autoantibodies are observed (21). In our cohort, patients in whom both predictors were present at baseline were 60 times more likely to develop definite SSc than were patients without these predictors.



Conclusion. In RP evolving to definite SSc, microvascular damage is dynamic and sequential, while SSc-specific autoantibodies are associated with the course and type of capillary abnormalities. Abnormal findings oping definite SSc, whereas their absence rules out this outcome.

The Many Faces of Scleroderma

Virginia D. Steen, MD

Department of Medicine, Georgetown University, 3800 Reservoir Road, LL Gorman, Washington, DC 20007, USA

Clinical studies have shown that the use of limited cutaneous and diffuse cutaneous scleroderma does not adequately predict the prognosis in many patients. Perhaps systemic sclerosis should be used as a generic term such as "cancer" or "heart disease" and then use the autoantibody subset as a distinct form of the disease. Treatment is still focused on individual organ systems and different antibody subsets have different frequency and severity of organ involvement. Thus, the antibody subsets still need to be lumped under the umbrella of systemic sclerosis. At this point, it seems prudent to put

Department of Medicine, Georgetown University, 3800 Reservoir Road, LL Gorman, Washington, DC 20007, USA

In summary, scleroderma-specific autoantibodies are strongly associated with meaningful clinical manifestations. These antibodies can be helpful in determining prognosis, and monitoring and treating patients. They should be used in performing clinical trials and in doing genetic and basic research. Hopefully, these scleroderma antibodies will lead to a better understanding of the pathogenesis of scleroderma.
