Treatment

Patients received 4 weekly pulses of rituximab (375 mg/m^2) at baseline, at 6 months, at 12 months and at 18 months, on top of the already administered treatment (details in Table I).

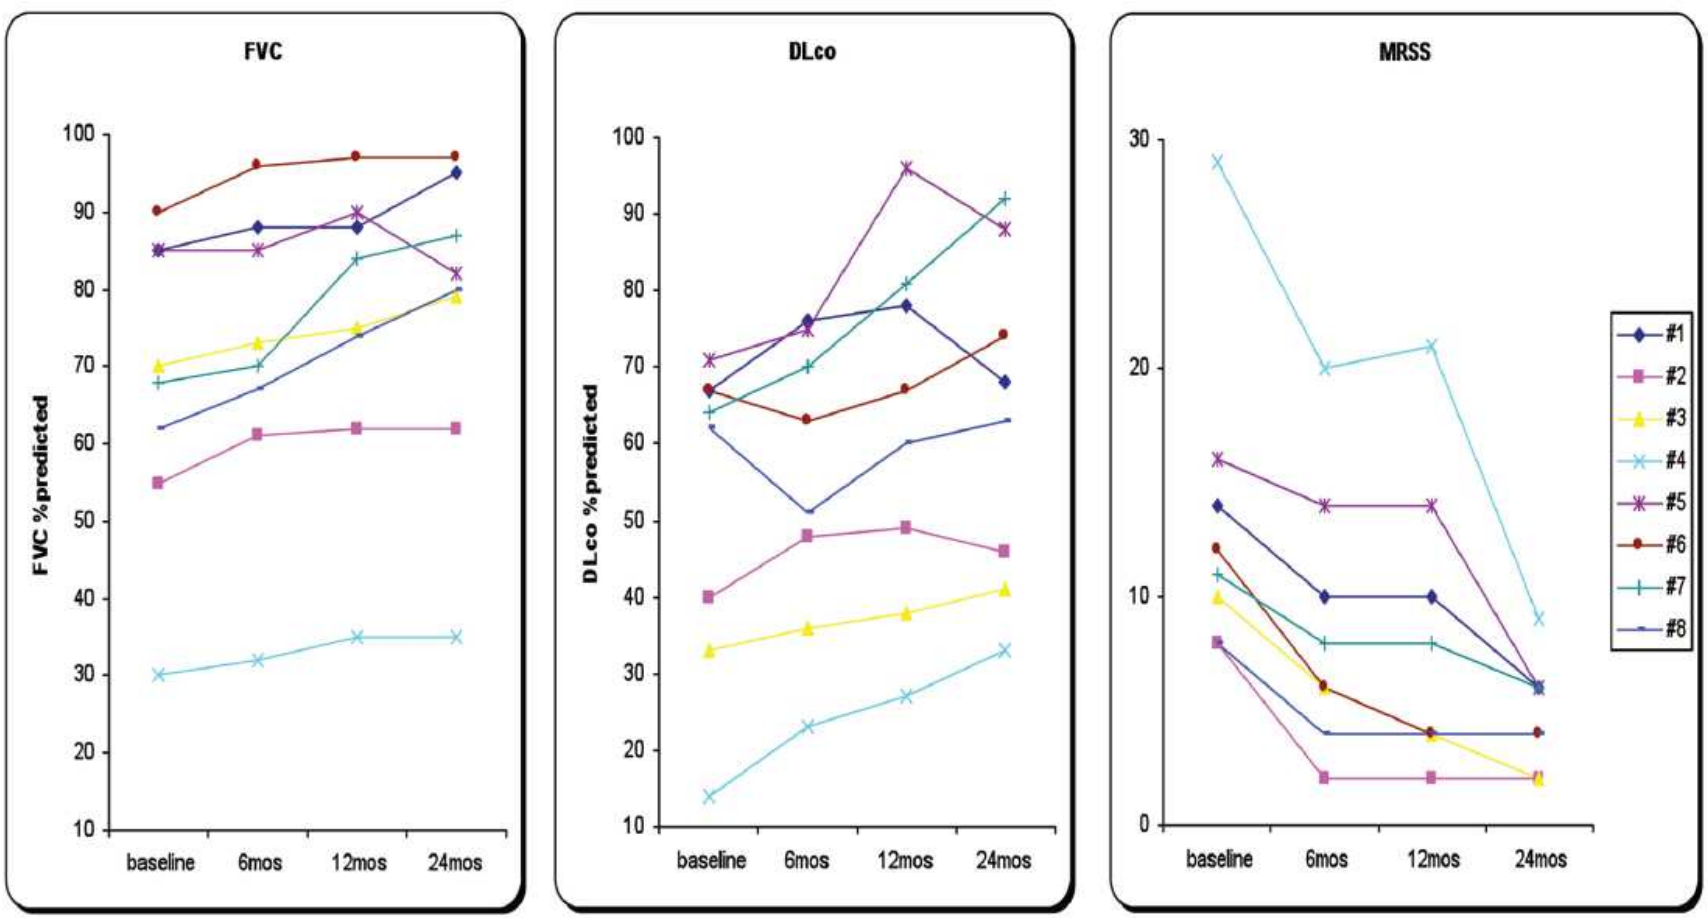

Fig. 1. Beneficial effect of long term RTX treatment on lung function and skin thickening in patients with SSc. RTX mediates a significant linear improvement of FVC ($p<0.0001$) and DLco ($p=0.0003$) during a 2-year follow-up (**A** and **B**, respectively). Similarly, skin thickening improved as indicated by a significant decline ($p<0.0001$) in MRSS (C).

Definitions and Diagnosis of Pulmonary Hypertension

RECOMMENDATIONS.

- The general definition of PH should remain unchanged. PH is defined by PAPm ≥25 mm Hg at rest measured by right heart catheterization (RHC).
- There are still insufficient data to introduce the term "borderline PH" for patients with PAPm levels between 21 and 24 mm Hg, especially because the prognostic and therapeutic implications remain unknown.
- Patients with PAPm values between 21 and 24 mm Hg should be carefully followed, in particular when they are at risk for developing PAH (e.g., patients with CTD, family members of patients with idiopathic pulmonary arterial hypertension [IPAH] or heritable pulmonary arterial hypertension [HPAH]).

Table 5. Univariate logistic regression for association with pulmonary arterial hypertension (PAH).

	n	OR (95% CI)	p
Age	247	1.08 (1.05, 1.1)	< 0.001
Female	247	0.8 (0.4, 1.7)	0.58
SSc disease duration	244	1.06 (1.0, 1.1)	0.001
ACA	236	2.78 (1.5, 5.2)	0.001
ATA	235	0.41 (0.2, 0.9)	0.03
TTE (continuous)	241	1.17 (1.1, 1.2)	< 0.001
FVC%/DLCO% (continuous)	246	4.93 (2.8, 8.6)	< 0.001
eRVSP > 40 mm Hg	241	40.28 (17.7, 91.8)	< 0.001
FVC%/DLCO% ≥ 1.6	246	8.19 (4.2, 16.1)	< 0.001

ACA: anti-centromere antibody; ATA: anti-topoisomerase antibody; TTE: transthoracic echocardiogram in mm Hg; eRVSP: estimated right ventricular systolic pressure; FVC%/DLCO%: forced vital capacity/DLCO percent predicted ratio.

Table 6. Multivariate logistic regression for association with pulmonary arterial hypertension (PAH).

	OR (95% CI)	p
Age	1.04 (0.996, 1.09)	0.07
SSc disease duration	0.99 (0.93, 1.05)	0.78
ACA	1.54 (0.53, 4.42)	0.43
ATA	0.53 (0.16, 1.79)	0.31
eRVSP > 40 mm Hg	29.34 (11.26, 76.41)	< 0.001
FVC%/DLCO% ≥ 1.6	2.98 (1.16, 7.66)	0.02

ACA: anti-centromere antibody; ATA: anti-topoisomerase antibody; eRVSP: estimated right ventricular systolic pressure; FVC%/DLCO%: forced vital capacity/DLCO percent predicted ratio.

Conclusion. In 2 large SSc cohorts, screening with TTE and PFT captured a majority of patients with PAH. TTE and PFT complement each other for the diagnosis of PAH. (J Rheumatol First Release Aug 15 2013 2013; doi:10.3899/jrheum.130400)
