Pregunta 2

Vamos a centrarnos ahora en el tema de la sanidad. De las siguientes afirmaciones que aparecen en esta tarjeta, ¿cuál expresa mejor su opinión sobre el sistema sanitario en nuestro país?

En general, el sistema sanitario funciona bastante bien	22.9
El sistema sanitario funciona bien, aunque son necesarios algunos cambios	47.7
El sistema sanitario necesita cambios fundamentales, aunque algunas cosas funcionan	23.6
Nuestro sistema sanitario está tan mal que necesitaríamos rehacerlo completamente	5.0

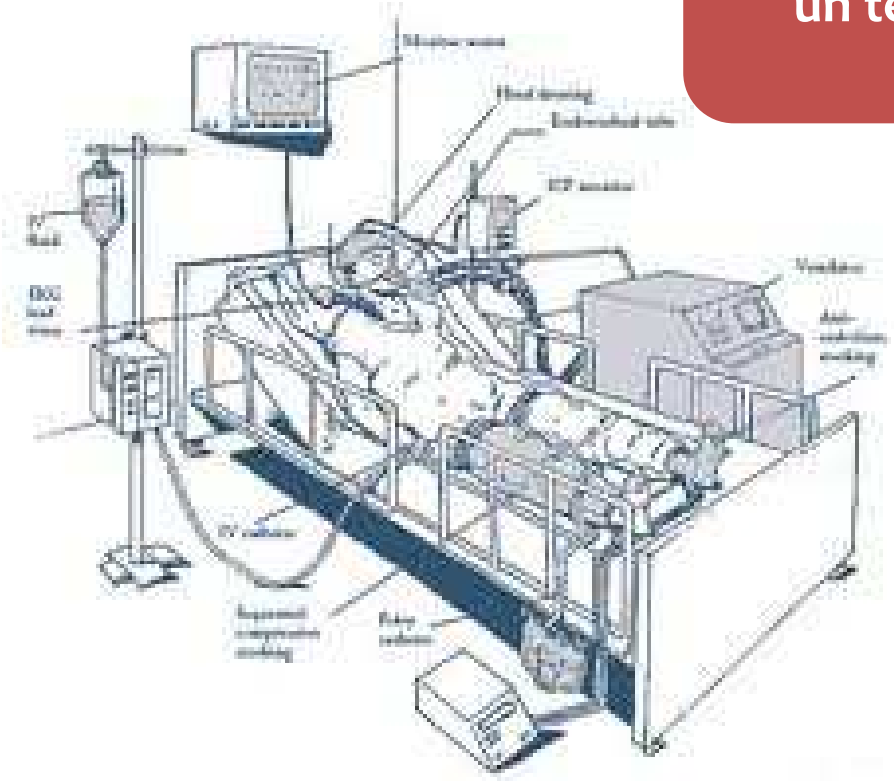
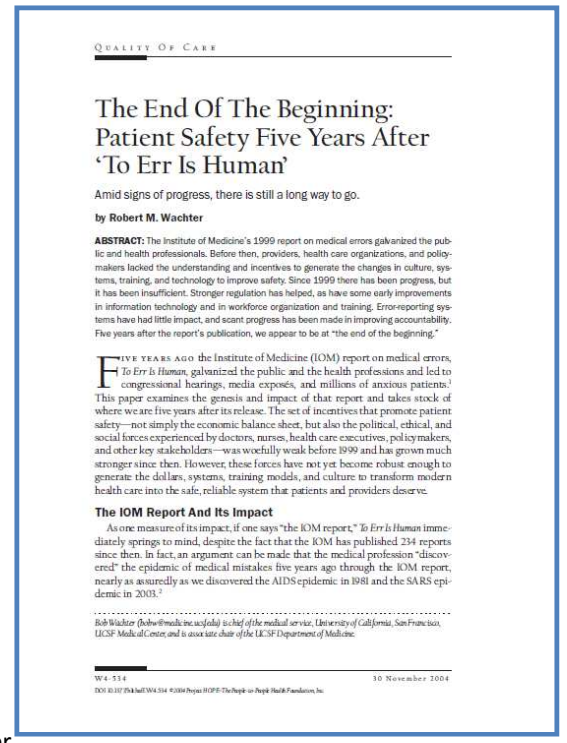
Un paciente de la UCI experimenta una media de 1,7 errores diarios, un tercio de los cuales pueden ser fatales. Health Affairs





QUALITY OF CARE

The End Of The Beginning: Patient Safety Five Years After 'To Err Is Human'

Amid signs of progress, there is still a long way to go.

by Robert M. Wachter

ABSTRACT: The Institute of Medicine's 1999 report on medical errors galvanized the public and health professionals. Before then, providers, health care organizations, and policymakers lacked the understanding and incentives to generate the changes in culture, systems, training, and technology to improve safety. Since 1999 there has been progress, but it has been insufficient. Stronger regulation has helped, as have some early improvements in information technology and in workforce organization and training. Error-reporting systems have had little impact, and scant progress has been made in improving accountability. Five years after the report's publication, we appear to be at "the end of the beginning."

FIVE YEARS AGO the Institute of Medicine (IOM) report on medical errors, *To Err Is Human*, galvanized the public and the health professions and led to congressional hearings, media exposés, and millions of anxious patients.[1] This paper examines the genesis and impact of that report and takes stock of where we are five years after its release. The set of incentives that promote patient safety—not simply the economic balance sheet, but also the political, ethical, and social forces experienced by doctors, nurses, health care executives, policymakers, and other key stakeholders—was woefully weak before 1999 and has grown much stronger since then. However, these forces have not yet become robust enough to generate the dollars, systems, training models, and culture to transform modern health care into the safe, reliable system that patients and providers deserve.

The IOM Report And Its Impact

As one measure of its impact, if one says "the IOM report," *To Err Is Human* immediately springs to mind, despite the fact that the IOM has published 234 reports since then. In fact, an argument can be made that the medical profession "discovered" the epidemic of medical mistakes five years ago through the IOM report, nearly as assuredly as we discovered the AIDS epidemic in 1981 and the SARS epidemic in 2003.[2]

Bob Wachter (bobw@medicine.ucsfdu) is chief of the medical service, University of California, San Francisco, UCSF Medical Center, and is associate chair of the UCSF Department of Medicine.

Prologue

Five Years Later—Are We Any Safer?

Brent C. James

The Institute of Medicine (IOM) released *To Err Is Human: Building a Safer Health System*,[1] its seminal summary of preventable patient injuries suffered within American hospitals, on November 29, 1999. This report was unique in one important way: it was the first IOM report directed as much to the general American public as at the U.S. government, the health care industry, members of the healing professions, and health policy experts. While evidence documenting high rates of treatment-associated injury and mortality have appeared in the peer-reviewed medical literature since the 1950s, neither the health professions nor the health care industry have ever prioritized patient safety as a critical imperative. The IOM's Committee on the Quality of Health Care in America, which produced *To Err Is Human*, sought—through its new public relations direction—to force patient safety to the pinnacle of the policy and care delivery improvement agendas. The committee set a goal of reducing fatalities associated with hospital-based care delivery by 50 percent within 5 years.

Five years have passed. A few institutions have reached the initial IOM goal for some injury sources (for example, Brigham & Women's Hospital in Boston for adverse drug events [ADEs]; Intermountain Health Care's LDS Hospital in Salt Lake City for ADEs and for postoperative wound infections; and Johns Hopkins University Hospital in Baltimore and Vanderbilt Hospital in Nashville for central venous catheter-associated infections). However, as a country, progress has fallen far short of the IOM's ambitious goal. Some members of the original IOM committee have publicly decried the lack of substantial progress,[2,3] citing a continuing inability by the United States to hold patient safety at the center of a national health care reform agenda. For example, even though more than 30 percent of a random sample of physicians responding to a survey reported that they or a member of their immediate family had experienced significant injuries when receiving care, physicians still see patient safety as a low priority.[4]

Temporal Trends in Rates of Patient Harm Resulting from Medical Care

ABSTRACT

BACKGROUND

In the 10 years since publication of the Institute of Medicine's report *To Err Is Human*, extensive efforts have been undertaken to improve patient safety. The success of these efforts remains unclear.

METHODS

We conducted a retrospective study of a stratified random sample of 10 hospitals in North Carolina. A total of 100 admissions per quarter from January 2002 through December 2007 were reviewed in random order by teams of nurse reviewers both within the hospitals (internal reviewers) and outside the hospitals (external reviewers) with the use of the Institute for Healthcare Improvement's Global Trigger Tool for Measuring Adverse Events. Suspected harms that were identified on initial review were evaluated by two independent physician reviewers. We evaluated changes in the rates of harm, using a random-effects Poisson regression model with adjustment for hospital-level clustering, demographic characteristics of patients, hospital service, and high-risk conditions.

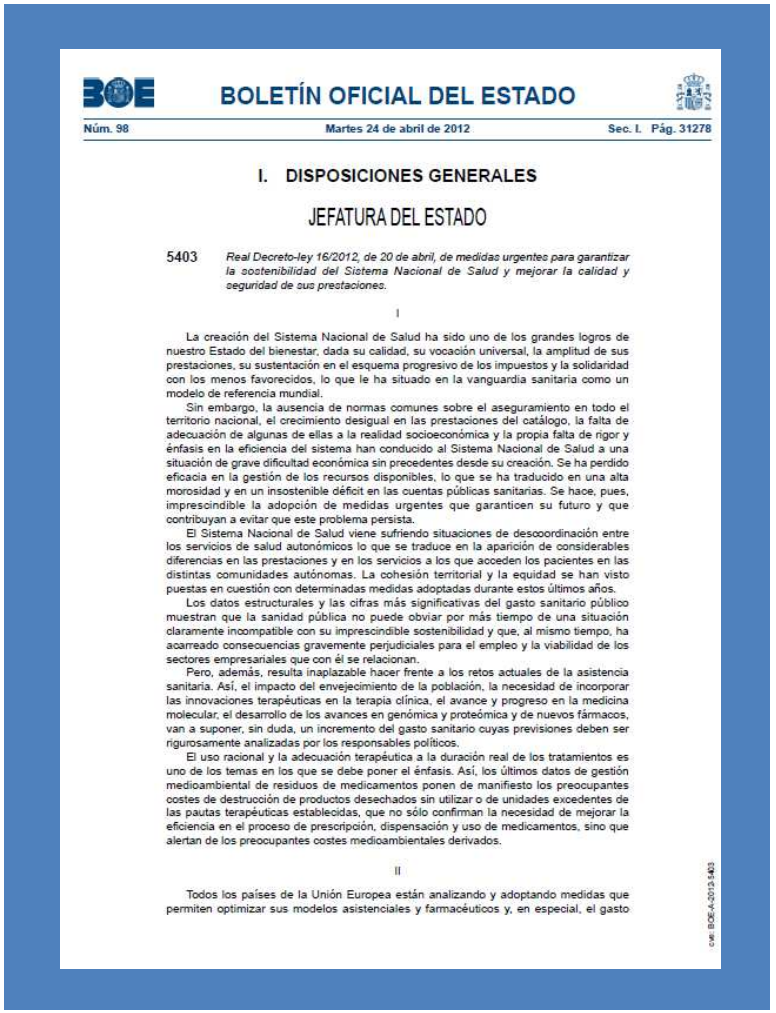
Real decreto ley 16/2012, de 20 de abril, de medidas urgentes para garantizar la sostenibilidad del Sistema nacional de Salud y mejorar así la calidad/seguridad de las prestaciones.



BOLETÍN OFICIAL DEL ESTADO
Núm. 98 Martes 24 de abril de 2012 Sec. I. Pág. 31278

I. DISPOSICIONES GENERALES

JEFATURA DEL ESTADO

5403 *Real Decreto-ley 16/2012, de 20 de abril, de medidas urgentes para garantizar la sostenibilidad del Sistema Nacional de Salud y mejorar la calidad y seguridad de sus prestaciones.*

I

La creación del Sistema Nacional de Salud ha sido uno de los grandes logros de nuestro Estado del bienestar, dada su calidad, su vocación universal, la amplitud de sus prestaciones, su sustentación en el esquema progresivo de los impuestos y la solidaridad con los menos favorecidos, lo que le ha situado en la vanguardia sanitaria como un modelo de referencia mundial.

Sin embargo, la ausencia de normas comunes sobre el aseguramiento en todo el territorio nacional, el crecimiento desigual en las prestaciones del catálogo, la falta de adecuación de algunas de ellas a la realidad socioeconómica y la propia falta de rigor y énfasis en la eficiencia del sistema han conducido al Sistema Nacional de Salud a una situación de grave dificultad económica sin precedentes desde su creación. Se ha perdido eficacia en la gestión de los recursos disponibles, lo que se ha traducido en una alta morosidad y en un insostenible déficit en las cuentas públicas sanitarias. Se hace, pues, imprescindible la adopción de medidas urgentes que garanticen su futuro y que contribuyan a evitar que este problema persista.

El Sistema Nacional de Salud viene sufriendo situaciones de descoordinación entre los servicios de salud autonómicos lo que se traduce en la aparición de considerables diferencias en las prestaciones y en los servicios a los que acceden los pacientes en las distintas comunidades autónomas. La cohesión territorial y la equidad se han visto puestas en cuestión con determinadas medidas adoptadas durante estos últimos años.

Los datos estructurales y las cifras más significativas del gasto sanitario público muestran que la sanidad pública no puede obviar por más tiempo de una situación claramente incompatible con su imprescindible sostenibilidad y que, al mismo tiempo, ha acarreado consecuencias gravemente perjudiciales para el empleo y la viabilidad de los sectores empresariales que con él se relacionan.

Pero, además, resulta inaplazable hacer frente a los retos actuales de la asistencia sanitaria. Así, el impacto del envejecimiento de la población, la necesidad de incorporar las innovaciones terapéuticas en la terapia clínica, el avance y progreso en la medicina molecular, el desarrollo de los avances en genómica y proteómica y de nuevos fármacos, van a suponer, sin duda, un incremento del gasto sanitario cuyas previsiones deben ser rigurosamente analizadas por los responsables políticos.

El uso racional y la adecuación terapéutica a la duración real de los tratamientos es uno de los temas en los que se debe poner el énfasis. Así, los últimos datos de gestión medioambiental de residuos de medicamentos ponen de manifiesto los preocupantes costes de destrucción de productos desechados sin utilizar o de unidades excedentes de las pautas terapéuticas establecidas, que no sólo confirman la necesidad de mejorar la eficiencia en el proceso de prescripción, dispensación y uso de medicamentos, sino que alertan de los preocupantes costes medioambientales derivados.

II

Todos los países de la Unión Europea están analizando y adoptando medidas que permiten optimizar sus modelos asistenciales y farmacéuticos y, en especial, el gasto

McKinsey Quarterly

Reforming the public sector in a crisis:

An interview with Sweden's former prime minister

Göran Persson has lived a story that should encourage leaders around the world: how to stay in power while pursuing a harsh crisis program that requires sacrifices throughout society.

Alastair Levy and Nick Lovegrove

Government leaders around the world face a daunting dual challenge: they must control and, in the long term, slash major budget deficits fueled by the economic crisis while at the same time improving the performance of the public sector so that it can meet its complex and ever-rising obligations.

Former Swedish prime minister Göran Persson is no stranger to that challenge. Even his political foes recognize his achievement.

In the early 1990s, Sweden suffered its deepest recession since the Great Depression. Although the Swedish crisis was homegrown, its causes and effects resemble the events unfolding in the world today. After years of strong domestic growth driven by easy credit and high leverage, a real-estate bubble burst, leading to the collapse and partial nationalization of the banking sector. Domestic demand plunged as the household savings ratio soared by 13 percentage points. In three years, public debt doubled, unemployment tripled, and the government budget deficit increased tenfold, to more than 10 percent of GDP, the largest in any OECD[1] country at the time.

Alastair Levy is a consultant in McKinsey's London office, and **Nick Lovegrove** is a director in the Washington, DC, office.

Effects of Pay for Performance on the Quality of Primary Care in England

Stephen M. Campbell, Ph.D., David Reeves, Ph.D., Evangelos Kontopantelis, Ph.D., Bonnie Sibbald, Ph.D., and Martin Roland, D.M.

ABSTRACT

BACKGROUND
A pay-for-performance scheme based on meeting targets for the quality of clinical care was introduced to family practice in England in 2004.

METHODS
We conducted an interrupted time-series analysis of the quality of care in 42 representative family practices, with data collected at two time points before implementation of the scheme (1998 and 2003) and at two time points after implementation (2005 and 2007). At each time point, data on the care of patients with asthma, diabetes, or coronary heart disease were extracted from medical records; data on patients' perceptions of access to care, continuity of care, and interpersonal aspects of care were collected from questionnaires. The analysis included aspects of care that were and those that were not associated with incentives.

RESULTS
Between 2003 and 2005, the rate of improvement in the quality of care increased for asthma and diabetes (P<0.001) but not for heart disease. By 2007, the rate of improvement had slowed for all three conditions (P<0.001), and the quality of those aspects of care that were not associated with an incentive had declined for patients with asthma or heart disease. As compared with the period before the pay-for-performance scheme was introduced, the improvement rate after 2005 was unchanged for asthma or diabetes and was reduced for heart disease (P=0.02). No significant changes were seen in patients' reports on access to care or on interpersonal aspects of care. The level of the continuity of care, which had been constant, showed a reduction immediately after the introduction of the pay-for-performance scheme (P<0.001) and then continued at that reduced level.

CONCLUSIONS
Against a background of increases in the quality of care before the pay-for-performance scheme was introduced, the scheme accelerated improvements in quality for two of three chronic conditions in the short term. However, once targets were reached, the improvement in the quality of care for patients with these conditions slowed, and the quality of care declined for two conditions that had not been linked to incentives. Continuity of care was reduced after the introduction of the scheme.

El nuevo esquema **aceleró las mejoras** de indicadores para dos o tres condiciones crónicas **a corto plazo**

No obstante**, a medio plazo,** la **mejora** de los indicadores **disminuyó** así como los indicadores de **otras patologias** que no se habían ligado a objetivos.

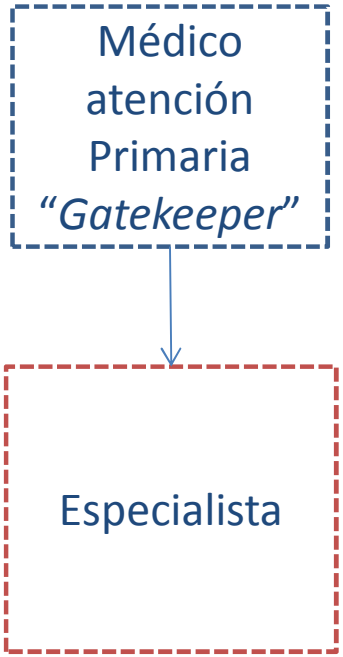
Experiencias: modelos con un nivel mayor de integración

KAISER PERMANENTE®

- Consorcio de gestión integrada. Proveedor de 8 regiones de EEUU. “HMO” (*Health Management Organization*)

- Integrado por dos tipos de organizaciones:

Kaiser Foundation Health Plans (KFHP)	Permanente Medical Group
Ofrece planes y seguros de salud	Organización que pertenece a médicos y que provee los cuidados médicos para KFHP



Experiencias: modelos con alto nivel de integración

KAISER PERMANENTE

Prácticas:

1. Integración real entre niveles
2. Atención de pacientes en el nivel más coste-efectivo (Minimizar el tiempo que los pacientes pasan en hospitales de coste elevado)
3. Sistemas de Información sofisticados y eficientes
4. Médicos asalariados (para evitar procedimientos innecesarios)

Algunos resultados:

- Énfasis en prevención y programas para crónicos
- Menor Nº de ingresos hospitalarios: 1/3 camas que usan en el NHS*
- Menor Estancia Media
- Tiempos de espera para ver un especialista en NHS: 6 veces más que en KP

Experiencias: Modelos con alto nivel de integración

"ACO. Accountable Care Organization"

- Integración de proveedores de diferente titularidad para prestar cuidados de salud a una población determinada.

1. **Cuidados integrados con la participación de un gran número de proveedores**
2. **Estructura formal legal que capacita la administración**
3. **Capacidad para sumar resultados y costes**
4. **Pago ligado a las métricas de calidad**

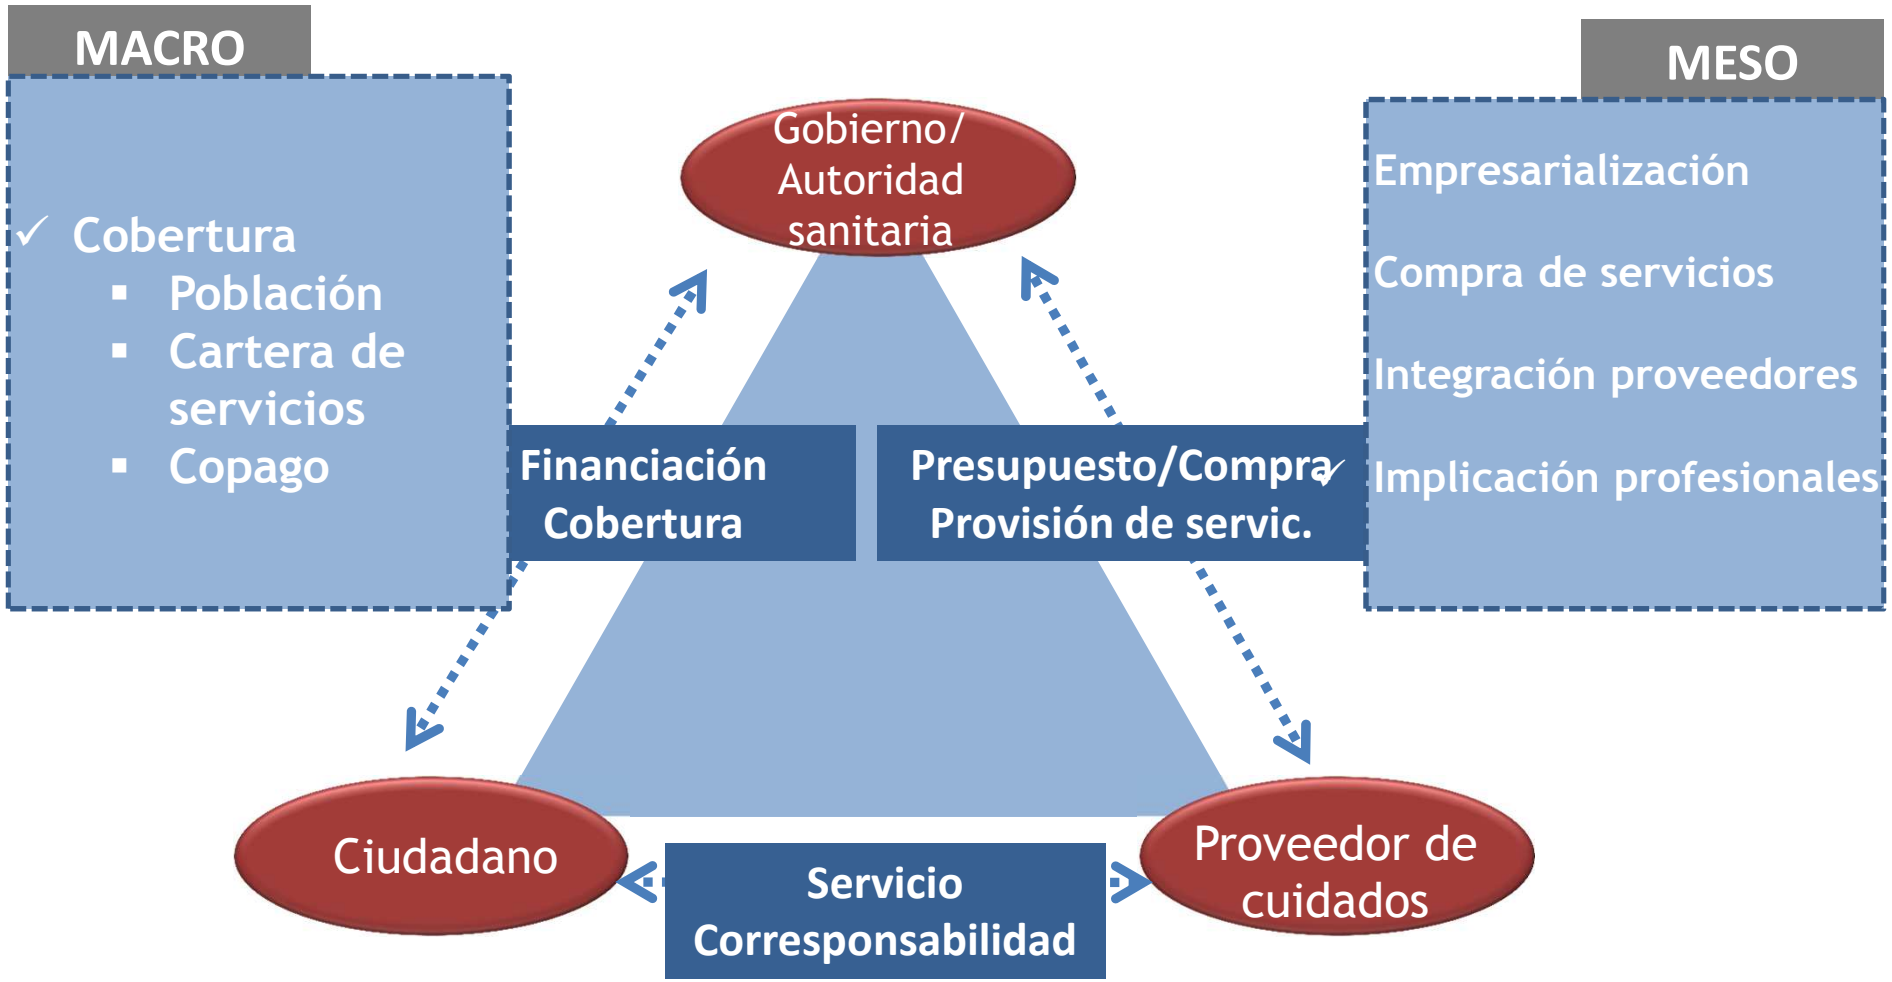
Reformas estructurales y barreras



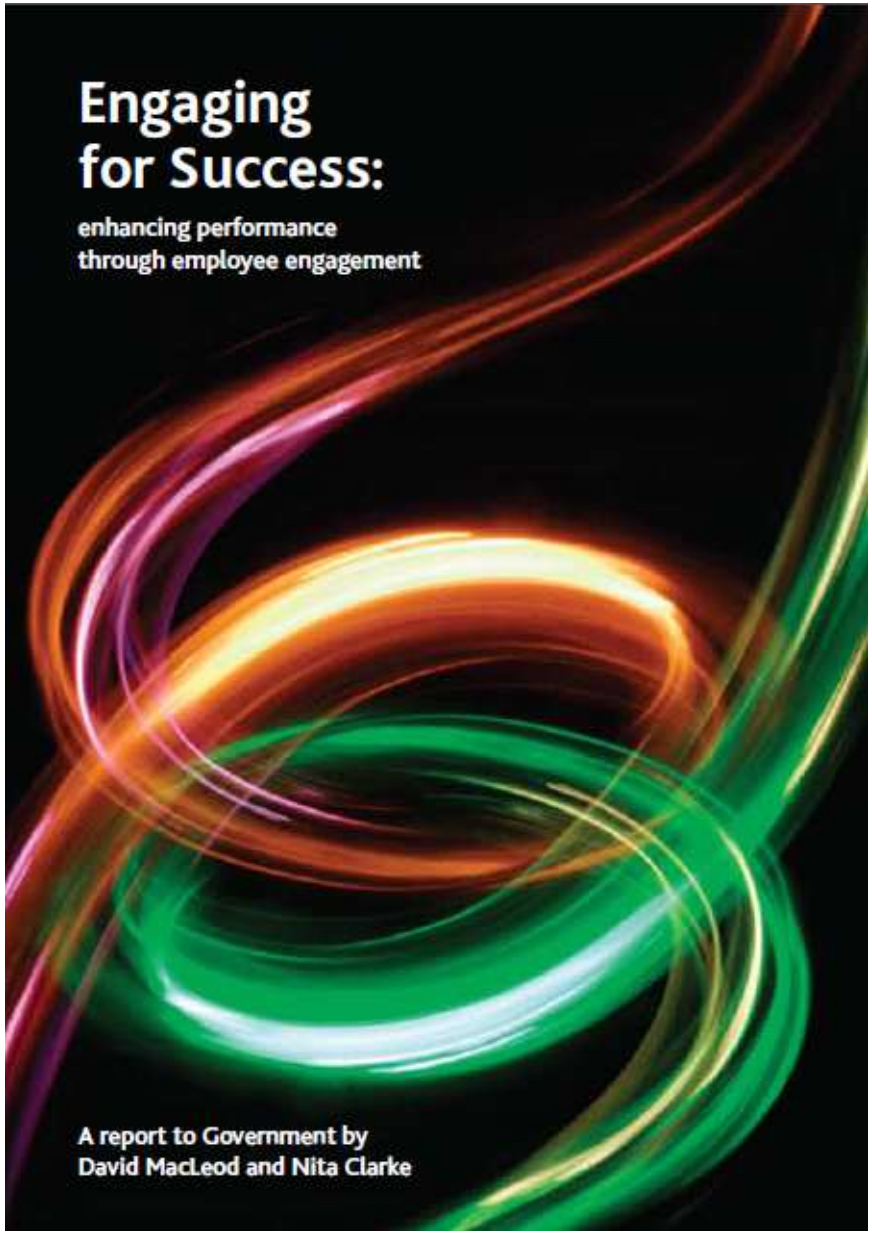
¿Que nos dice la literatura ?

El compromiso tiene impacto en los resultados

El compromiso se puede medir

El compromiso es gestionable

El compromiso tiene impacto en los resultados



Chapter 1

Employee Engagement – What, why and how

1 This chapter summarises our findings on the importan to the UK, looks at some of the barriers to engagemen characteristics, and outlines our recommendations to t

2 The following chapters detail more of the evidence abo the barriers (chapter 3) and some of the factors that lie behind successful engagement (chapter 4). Our recommendations in full can be found in chapter 5.

3 This report is about unlocking people's potential at work and the measurable benefits of doing so for the individual, the organisation and, ultimately, for the UK.

4 It is about retaining and building on the commitment, energy and desire to do a good job that characterises most people, that 'first day at work' feeling, to maximise individual and organisational performance.

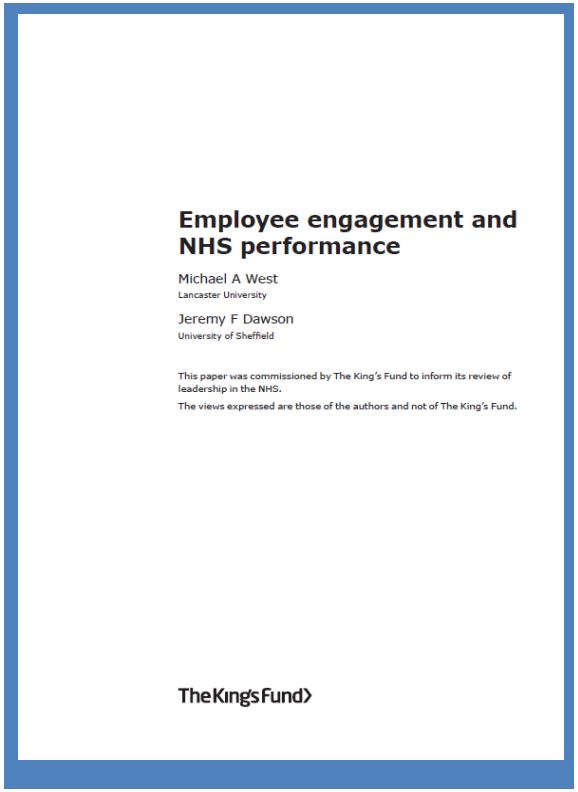
5 Business and organisations function best when they make their employees' commitment, potential, creativity and capability central to their operation. Clearly, having enough cash, and a sensible strategy, are vital. But how people behave at work can make the crucial difference between business and operational success or failure.

6 Employee engagement strategies enable people to be the best they can at work, recognising that this can only happen if they feel respected, involved, heard, well led and valued by those they work for and with. As a representative of the home insulation company KHI put it: *"employee engagement is when the business values the employee and the employee values the business"* (submitted via the review's online call for evidence).

7 Engaged employees have a sense of personal attachment to their work and organisation; they are motivated and able to give of their best to help it succeed – and from that flows a series of tangible benefits for organisation and individual alike.

8 *"You sort of smell it, don't you, that engagement of people as people. What goes on in meetings, how people talk to each other. You get the sense of energy, engagement, commitment, belief in what the organisation stands for,"* is how Lord Currie, former Chair of the Office of Communications (Ofcom) and Dean of Cass Business School, puts it. As a number of business leaders told us, *"You know it when you see it."*

El compromiso tiene impacto en los resultados



Outcomes of engagement

- ✓ Better patient experience
- ✓ Better quality of services
- ✓ Higher quality of financial performance
- ✓ Lower patient mortality and infection rates
- ✓ Lower Absenteeism
- ✓ Lower turnover rates

The NHS Staff Survey ,2009

- 156.951 staff responding
- 388 different trusts

El compromiso es medible.

EDITOR'S CHOICE

Too much medicine

Fiona Godlee *editor, BMJ*

There's a great deal to celebrate in medicine and healthcare, but it's also possible to have too much of a good thing. This week we launch our Too Much Medicine campaign (www.bmj.com/too-much-medicine). As explained in an editorial (doi:10.1136/bmj.f1271), the roots of the campaign go back at least a decade to a theme issue we published in 2002, guest edited by Ray Moynihan, called "Too much medicine?" You can find the entire issue on bmj.com (www.bmj.com/content/324/7342). Much of the content is as relevant now as it was controversial then.

Since then, the evidence of medical excess in rich countries has grown, with increasingly clear documentation of the harms and costs of unnecessary intervention. In the past few years the individuals and groups calling for moderation and scepticism have begun to coalesce into a loose movement, to which the *BMJ* is now signing up. Impressed by the "Less is more" initiative at *JAMA Internal Medicine*, led by its editor Rita Redberg, and by the Choosing Wisely initiative set up by the American Board of Internal Medicine Foundation (doi:10.1136/bmj.f1266), we want to explore the causes and potential remedies of overinvestigation, overdiagnosis, and overtreatment.

As our Editorial points out, this area is complex and under-researched: in many healthcare settings overtreatment and undertreatment coexist. "Because of this and other uncertainties, it will not be easy to communicate effectively about overdiagnosis with professionals and the public. The concept is unfamiliar and counterintuitive to many people." Our contribution will include partnering in an international scientific conference in September (preventingoverdiagnosis.net) and publishing a theme issue early next year.

This week's journal carries its own dose of cold water with which to douse medical enthusiasts. In an editorial, Edwin Gale calls for a serious rethink about the use of GLP-1 agonists in diabetes because of strong evidence of increased rates of pancreatitis among patients taking these drugs (doi:10.1136/bmj.f1263). He asks why drug companies have been so slow to act on the signals and concludes that inviting drug companies to monitor the safety of their own products provides them with the strongest possible incentive for failing to do so. And in the Analysis section, Tom Treasure and Martin Utley question the benefits of surgical removal of pulmonary metastases. The evidence that this invasive procedure improves survival is weak, they say. They call for randomised trials rather than the dubious case series on which current practice is based (doi:10.1136/bmj.f824). One such innovative trial is now under way thanks to a previous *BMJ* paper from these authors.

Also this week, the *BMJ* speaks up for the Liverpool care pathway, which is under attack from the *Daily Mail* and others. We are emboldened to do so by a survey we undertook among palliative care doctors in the UK. As summarised by Krishna Chinthapalli, 91% of respondents thought that the pathway represented best practice for care of the dying patient (doi:10.1136/bmj.f1184). And when asked if they would want to be put on the pathway themselves if they were terminally ill, 90% said yes. This vote of confidence fits with views expressed at a conference in Edinburgh last week (doi:10.1136/bmj.f1303). Helping patients to die with dignity should be done with the same care and openness as anticipating and managing the birth of a child.

The Lown Institute

News & Articles | Events | Strategic Initiatives | About Us

About the Right Care Alliance

The Right Care Alliance is a major new initiative of the Lown Institute that is designed to change the culture of American medicine from "more is better" to the right care for the right patient. We are developing an international network of clinicians, patients, community organizations, and health care institutions who recognize the epidemic of overuse in American medicine, and who are dedicated to eliminating it, and to ensuring that patients get the care they need.

In April 2012, the Lown Foundation and the New America Foundation convened the Avoiding Avoidable Care conference - the first major medical meeting dedicated entirely to understanding the problem of overuse of medical services. The meeting highlighted the need for active cooperation among clinicians, patient advocates, and policy makers in order to address this pervasive and harmful aspect of medicine. The Right Care Alliance was founded by Lown Institute President, Vikas Saini, Senior Vice President, Shannon Brownlee, and our Advisory Council to facilitate that cooperation.

The Right Care Alliance will be a distinct and complementary voice in the emerging campaign to address overuse. Our strategy is to identify and challenge the cultural aspects of overuse, the underlying attitudes, behaviors, and narratives that have persuaded clinicians and the public that more is better in medicine. We will highlight the issue of overuse as an entry point to a broader conversation about the purpose of health care in our society, the ethical and social responsibilities of the medical profession, and the need for a new social contract between the medical profession, the health care industry, and civil society.

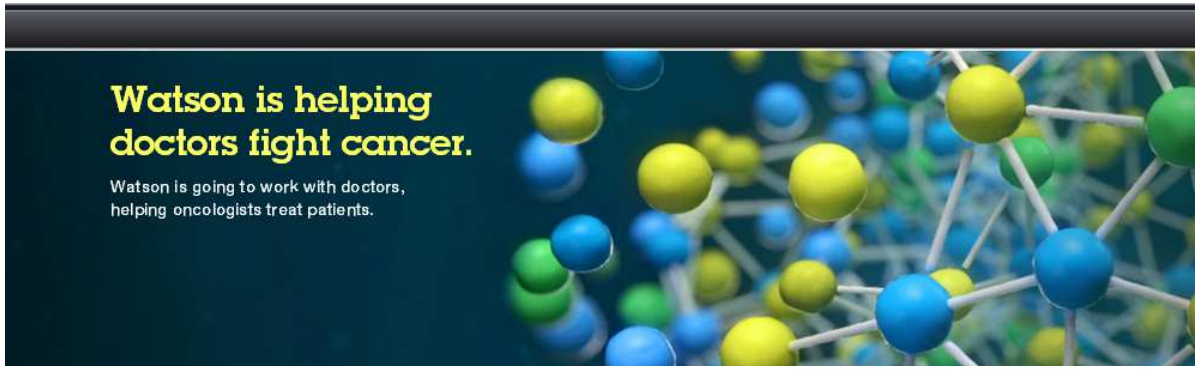
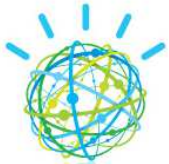
IBM's Watson



How Watson can address healthcare challenges

Watson uses natural language capabilities, hypothesis generation, and evidence-based learning to support medical professionals as they make decisions. For example, a physician can use Watson to assist in diagnosing and treating patients. First the physician might pose a query to the system, describing symptoms and other related factors. Watson begins by parsing the input to identify the key pieces of information. The system supports medical terminology by design, extending Watson's natural language processing capabilities.



Watson then mines the patient data to find relevant facts about family history, current medications and other existing conditions. It combines this information with current findings from tests and instruments and then examines all available data sources to form hypotheses and test them. Watson can incorporate treatment guidelines, electronic medical record data, doctor's and nurse's notes, research, clinical studies, journal articles, and patient information into the data available for analysis.

Watson will then provide a list of potential diagnoses along with a score that indicates the level of confidence for each hypothesis.

The ability to take context into account during the hypothesis generation and scoring phases of the processing pipeline allows Watson to address these complex problems, helping the doctor — and patient — make more informed and accurate decisions.

Quality Of Care

The End Of The Beginning: Patient Safety Five Years After 'To Err Is Human'

Amid signs of progress, there is still a long way to go.

by Robert M. Wachter

ABSTRACT: The Institute of Medicine's 1999 report on medical errors galvanized the public and health professionals. Before then, providers, health care organizations, and policymakers lacked the understanding and incentives to generate the changes in culture, systems, training, and technology to improve safety. Since 1999 there has been progress, but it has been insufficient. Stronger regulation has helped, as have some early improvements in information technology and in workforce organization and training. Error-reporting systems have had little impact, and scant progress has been made in improving accountability. Five years after the report's publication, we appear to be at "the end of the beginning."

Five years ago the Institute of Medicine (IOM) report on medical errors, *To Err Is Human*, galvanized the public and the health professions and led to congressional hearings, media exposés, and millions of anxious patients.[1] This paper examines the genesis and impact of that report and takes stock of where we are five years after its release. The set of incentives that promote patient safety—not simply the economic balance sheet, but also the political, ethical, and social forces experienced by doctors, nurses, health care executives, policymakers, and other key stakeholders—was woefully weak before 1999 and has grown much stronger since then. However, these forces have not yet become robust enough to generate the dollars, systems, training models, and culture to transform modern health care into the safe, reliable system that patients and providers deserve.

The IOM Report And Its Impact

As one measure of its impact, if one says "the IOM report," *To Err Is Human* immediately springs to mind, despite the fact that the IOM has published 234 reports since then. In fact, an argument can be made that the medical profession "discovered" the epidemic of medical mistakes five years ago through the IOM report, nearly as assuredly as we discovered the AIDS epidemic in 1981 and the SARS epidemic in 2003.[2]

Bob Wachter (bwachter@medicine.ucsf.edu) is chief of the medical service, University of California, San Francisco, and UCSF Medical Center, and is associate chair of the UCSF Department of Medicine.

Improved Quality At Kaiser Permanente Through E-Mail Between Physicians And Patients

Yi Yvonne Zhou[1,*], Michael H. Kanter[2], Jian J. Wang[3] and Terhilda Garrido[4]

*Corresponding author

Abstract

The American Recovery and Reinvestment Act identified secure patient–physician e-mail messaging as an objective of the meaningful use of electronic health records. In our study of 35,423 people with diabetes, hypertension, or both, the use of secure patient–physician e-mail within a two-month period was associated with a statistically significant improvement in effectiveness of care as measured by the Healthcare Effectiveness Data and Information Set (HEDIS). In addition, the use of e-mail was associated with an improvement of 2.0–6.5 percentage points in performance on other HEDIS measures such as glycemic (HbA1c), cholesterol, and blood pressure screening and control.

Mejora de resultados en diabetes e hipertensión mediante control vía email

Telemonitorización

Examples of successful post-acute care monitoring programmes include:

- A 2010 Catalan Remote Management Evaluation (CARME) study in Spain compared outcomes of 92 heart failure patients using telemedicine to outcomes from the previous 12 months of care without telemedicine. Researchers found that patient-reported quality of care increased by 62 percent and reported dissatisfaction decreased by 22 percent. The study also reported a 68 percent decrease in hospitalisation (including readmissions) for heart conditions.[34]

68% de disminución en hospitalizaciones en insuficiencia cardiaca

33% de disminución de visitas a urgencias
